## LIST OF ILLUSTRATIONS

Map (facing title-page). Angola.

- IX. Basket-work Patterns, Ovimbundu, Elende. Cat. Nos. 208944-50, actual size. Fig. 1. Big star (*olombungululu vinene*). Fig. 2. Trunk of *epangue* tree (*ocisila cepangu*). Fig. 3. Wave pattern (*apuku atito*). Fig. 4. Kerchief pattern (*alesu*). Fig. 5. Arrow (*usongo*). Fig. 6. A reclining object (*onjandu*). Fig. 7. Following one another (*imbagu*). Fig. 8. Hoe handle (*ovipi viatimo*). Fig. 9. Spots (*atumba*).
- X. Basket-work Patterns, Ovimbundu, Elende. Cat. Nos. 208087, 208879-82, actual size. Fig. 1. Wave pattern (*apuku atito*). Fig. 2. Pattern of kings (*olosoma*). Fig. 3. Ribbed pattern (*olomati*). Fig. 4. Double arrow (*usonge wayombo*). Fig. 5. Star (*olombungululu*).
- XI. Incised and Burned Designs on a Gourd, Vachokue, Kuchi. Cat. No. 208032, dimensions 23 x 23 cm, patterns half actual size.
- XII. Incised and Burned Decorations on Gourds. Fig. 1. From the chief village of the Vangangella, Ngalandi. Cat. No. 208007, dimensions 26 x 4 cm. Fig. 2. Ovimbundu, Elende. Cat. No. 208012, dimensions 21 x 8.5 cm. Fig. 3. Ovimbundu, Elende. Cat. No. 208010, dimensions 15 x 10 cm. Fig. 4. Ovimbundu, Elende. Cat. No. 208004, dimensions 31 x 20 cm. Fig. 5. Ovimbundu, Elende. Cat. No. 208013, dimensions 22 x 9.5 cm. Fig. 6. Gourd used to contain beer for a bride and groom, Ovimbundu, Bailundu. Cat. No. 208001, dimensions 39 x 26 cm.
- XIII. Wooden Combs, Tools, Domestic Implements, and Weapons. Fig. 1. Knife used for cutting branches, Vasele. Cat. No. 208427, dimensions 50 x 5 cm. Fig. 2. Combined ax and adze, Ovimbundu, Elende. Cat. No. 208432, length 73 cm. Fig. 3. Wooden pounder for maize, Ovimbundu, Elende. Cat. No. 208404, length 31 cm. Fig. 4. Small ax used by medicine-man when dancing to drive away evil spirits, Ovimbundu, Bailundu. Cat. No. 208415,

length 32.5 cm. Fig. 5. Ceremonial ax, formerly used for beheading slaves at the death of a king, Vasele, near Vila Nova de Selles. Cat. No. 208263, length 42 cm. Fig. 6. Hunter's pouch for ammunition, Ovimbundu, Elende. Cat. No. 209059, dimensions 15 x 12 cm. Fig. 7. Three wooden hair-combs, Ovimbundu, Elende, and Vachokue, Cangamba. Cat. Nos. 208462, 208459, 208453, one-fourth actual size. Fig. 8. Iron spear, Ovimbundu, Bailundu. Cat. No. 208244, length 37 cm. Fig. 9. Hoe, Ovimbundu, Elende. Cat. No. 208429, length 51 cm. Fig. 10. Hoe used by Vangangella, Ngalangi. Cat. No. 208439, length 85 cm.

- XIV. Pottery and Wooden Utensils. Fig. 1. Earthenware water-jar, Ovimbundu, Elende. Cat. No. 208208, dimensions 42 x 14 cm. Fig. 2. Small cooking pot, Vasele, near Vila Nova de Selles. Cat. No. 208201, dimensions 12 x 10 cm. Fig. 3. Earthenware water-bottle, Vasele, Vila Nova de Selles. Cat. No. 209007, dimensions 24 x 23 cm. Fig. 4. Earthenware food bowl, Ovimbundu, Elende. Cat. No. 208223, dimensions 20 x 9.5 cm. Fig. 5. Cooking pot, Ovimbundu, Elende. Cat. No. 208202, dimensions 16.5 x 13 cm. Fig. 6. Milk vessel, Vakuanyama, Mongua. Cat. No. 208152, dimensions 28 x 21 cm. Fig. 7. Wooden spoon, Vachokue, Kuchi. Cat. No. 208143, dimensions 34 x 9 cm. Fig. 8. Wooden milk jug, Vakuanyama, Mongua. Cat. No. 208243, dimensions 21 x 13 cm. Fig. 9. Wooden spoon and stirrer, Vachokue, Cangamba. Cat. No. 208164, dimensions 60.5 x 9.5 cm.

- XV. Tobacco-pipes, Snuff Box, Rat Trap, and Basket. Fig. 1. Tobacco-pipe, Vachokue, Ngalangi. Cat. No. 208715, length 74 cm. Fig. 2. Tobacco-pipe, Ovimbundu, Elende. Cat. No. 208709, length 35 cm. Fig. 3. Water-pipe for smoking tobacco and hemp, Vachokue, Cangamba. Cat. No. 208688, length 29 cm. Fig. 4. Carved wooden snuff box, Ovimbundu, Elende. Cat. No. 208708, length 23 cm. Fig. 5. Wicker rat trap, Ovimbundu, Elende. Cat. No. 208039, length 33 cm. Fig. 6. Coiled basket with

inwoven patterns of amber and black, Ovimbundu, Bailundu. Cat. No. 208926, dimensions 37 x 18 cm.

- XVI. Tools and Weapons. Fig. 1. Spearhead, Vachokue, Munyangi. Cat. No. 208372, dimensions 30.5 x 3.3 cm. Fig. 2. Knife, Vachokue, Saurimo in Lunda. Cat. No. 208375, dimensions 21.5 cm. Fig. 3. Blacksmith's hammer, Vangangella, Ngalangi. Cat. No. 208826, length 18 cm. Fig. 4. Saw of native make, Ovimbundu, Elende. Cat. No. 208362, length 71 cm. Fig. 5. Iron-bladed tool for boring wood, Ovimbundu, Elende. Cat. No. 208368, length 57 cm. Fig. 6. Blacksmith's tongs, Ovimbundu, Elende. Cat. No. 208813, length 52 cm. Fig. 7. Blacksmith's hammer, Ovimbundu, Elende. Cat. No. 208823, length 33 cm. Fig. 8. Axhead, Vachokue, Cangamba. Cat. No. 208817, length 26 cm. Fig. 9. Blacksmith's punch, Ovimbundu, Elende. Cat. No. 208816, length 24 cm. Fig. 10. Knife in wooden scabbard, Vakuanyama, Mongua. Cat. No. 208357, length 54 cm. Fig. 11. Brass bracelet made by blacksmith, Elende. Cat. No. 208503, width 5 cm. Fig. 12. Bellows of blacksmith, Ngalangi. Cat. No. 208831, dimensions 55 x 34 cm.
- XVII. Bows and Arrowheads. Fig. 1. The bow and arrow, with details of stringing and feathering, are typical of implements of Ovimbundu and Vachokue tribes. Cat. No. 208663, length 143 cm. The arrowheads were collected from Vachokue hunters from Cangamba to Saurimo in Lunda. Cat. Nos. 208643-652, 654, 656, length average 80 cm. Fig. 2. Arrowheads, Ovimbundu, Elende. Cat. Nos. 208623, 615, 618, 616, length of each about 80 cm. Fig. 3. Wooden arrow for shooting birds, Ovimbundu, Elende. Cat. No. 208633, length 88 cm. Figs. 4-6. Socketed iron arrowheads, Vakuanyama, Mongua. Cat. Nos. 208598, 592, 601, lengths 67, 58, 66 cm. Fig. 7. Barbed wooden arrow, Vakipungo, southwest Angola. Cat. No. 208607, length 83 cm. Fig. 8. Flat bow and arrow, Vakuanyama, Mongua. Cat. No. 208659, length 122 cm. Fig. 9. Arrow for shooting lizards, Vasele. Cat. No. 208657, length 87 cm.

- XVIII. Hut Furniture and Mask. Fig. 1. Wooden seat with hide top, Ovimbundu, Ngalangi. Cat. No. 208180, dimensions 53 x 28 x 30 cm. Fig. 2. Wooden stool, Ovimbundu, Elende. Cat. No. 208864, dimensions 29 x 21 cm. Fig. 3. Wooden chair with hide seat, Vachokue, Bailundu. Cat. No. 209006, height 80 cm. Fig. 4. Wooden mask, type used by Vangangella and Ovimbundu, Ngongo, Ngalangi. Cat. No. 208100, dimensions 20 x 18 cm.
- XIX. Wood-carving, Ovimbundu. Fig. 1. A hawk, Bailundu. Cat. No. 208386, dimensions 37 x 16 cm. Fig. 2. Crane, Bailundu. Cat. No. 208381, dimensions 27 x 10 cm. Fig. 3. Guinea fowl, burned black and speckled with white paint, Elende. Cat. No. 208382, dimensions 20 x 8 cm. Fig. 4. Lizard, Elende. Cat. No. 208394, dimensions 41 x 6 cm. Fig. 5. Snake, Elende. Cat. No. 208391, length 24 cm.
- XX. Staffs of Village Chiefs. Fig. 1. Ovimbundu, Elende. Cat. No. 208778, length 68 cm. Fig. 2. Vachokue, Cangamba. Cat. No. 208775, length 82 cm. Fig. 3. Ovimbundu, Elende. Cat. No. 208757, length 35 cm. Fig. 4. Vachokue, Kuchi. Cat. No. 208754, length 98 cm. Fig. 5. Ovimbundu, Elende. Cat. No. 208772, length 90 cm. Fig. 6. Staff of dead king from hut in which relics of kings are kept, from capital village of Ngalangi. Cat. No. 208748, length 123 cm. Fig. 7. Club of heavy black wood, Ovimbundu, Elende, workmanship of Vachokue and Lunda type. Cat. No. 208777, length 71 cm. Fig. 8. Staff of office in form of paddle, carried by headman of Lioko, a village of Ngalangi. Cat. No. 208745, dimensions 127 x 16 cm. Fig. 9. Heavy throwing-club for killing small game, Ovimbundu, Elende. Cat. No. 208767, dimensions 40 x 12 cm. Fig. 10. Ornamental club, Ovimbundu, Elende. Cat. No. 208764, length 56 cm.
- XXI. Carved Human Figures. Fig. 1. Wooden figure nursed in place of dead twin, Ovimbundu and Vangangella, Ngalangi. Cat. No. 208345, length 20 cm. Fig. 2. Wooden figure from divination basket of medicine-man, Ovimbundu, Elende. Cat. No. 208307, length

7 cm. Fig. 3. Wooden figure placed by anvil of blacksmith. Spirit in figure assists blacksmith, Ovimbundu, Elende. Cat. No. 208339, length 36 cm. Fig. 4. Female wooden figure used by Vachokue medicine-man, Cangamba. Body hollow to contain medicine, head detachable. Cat. No. 208355, length 61 cm. Fig. 5. Female wooden figure used by medicine-man for divining correct path on caravan journey, Ovimbundu, Bailundu. Cat. No. 208346, length 27 cm. Fig. 6. Wooden figure used like No. 1, Ovimbundu, Elende. Cat. No. 208326, length 18 cm.

- XXII. Musical Instruments. Fig. 1. Dumb-bell basket rattle, Vachokue, Cangamba. Cat. No. 208732, length 26 cm. Fig. 2. Wooden flute, Ovimbundu, Elende. Cat. No. 208723, length 29 cm. Fig. 3. Instrument played by rubbing grooves with stick, Ovimbundu, Elende. Cat. No. 208805, dimensions 43 x 21 cm. Fig. 4. Rattles for ankles, made from seed pods, Ovimbundu, Bailundu. Cat. No. 208730, length 21 cm. Fig. 5. Instrument, metal keys on wooden board, Ovimbundu, Elende. Cat. No. 208734, dimensions 18 x 11 cm. Fig. 6. Musical bow, Ovimbundu, Elende. Cat. No. 208722, length 109 cm. Fig. 7. Strip of rattan. May be bent to form musical bow, Ovimbundu, Elende. Cat. No. 208810, length 62 cm. Fig. 8. Frictional instrument, played like No. 3, Ovimbundu, Bailundu.

- XXIII. Drawings Representing Life of Ovimbundu, Elende. Made by untrained Ocimbundu youth, Elende, who had lived with Europeans. Fig. 1. Ovimbundu hunters. Fig. 2. Medicine-man of Ovimbundu divining. Fig. 3. Ocimbundu woman making beer. Fig. 4. Relative of deceased interrogating corpse as to cause of death. Chief mourners in group on left.

- XXIV. Examples of Scarification. Fig. 1. Ocimbundu woman, Ngalangi. Fig. 2. Vachokue woman, Cubango. Fig. 3. Esele woman. Cuts, made to cure pain, were rubbed with charred gourd. Fig. 4. Ocimbundu woman, Elende. Scar made at age of ten years by male operator, charred rubber placed in cuts. Fig. 5. Ocimbundu woman, Cuma. Scars ornamental and tribal.

- XXV. Positions of Hands in Drumming, Ovimbundu, Elende. Front View.
- XXVI. Positions of Hands in Drumming, Ovimbundu, Elende. Side View.

- XCII. Fig. 1. Mound of Earth Where Childless Women Are Covered with Mud to Give Fertility, Vangangella, Ngalangi. Fig. 2. Trap for Leopards, Cangamba.

## PREFACE

As leader of the Frederick H. Rawson-Field Museum Ethnological Expedition to West Africa I undertook research in Angola and Nigeria, from February, 1929, to February, 1930. The present publication is concerned with the ethnology of Angola (Portuguese West Africa), where a study of the Ovimbundu and their culture contacts was made.

At the outset I must express thanks to the Portuguese government for permission to carry on this investigation. Owing to the courtesy of the American Vice-Consul, Mr. Arthur F. Tower of Loanda, I received from the Governor General of Angola a letter of introduction which was of inestimable service during my journey in the interior.

From Portuguese officials much help was obtained, and sound advice accompanied by practical assistance was always courteously given.

In London I was assisted in the most cordial way by Mr. David Boyle, of the Cunard Steamship Lines, and Colonel B. Follett, D.S.O., of the Tanganyika Concessions Company.

My base camp in Angola was pitched near the Elende Mission Station, where Dr. Merlin W. Ennis kindly provided safe storage for collections and a room for photography. Dr. Ennis was ever ready to discuss and aid my investigation among the Ovimbundu with whom he has spent thirty years. Mrs. Ennis and Miss Rounds aided my studies of handicraft among women. Dr. Hollenbeck gave valuable notes on the ailments of the Ovimbundu; these have been incorporated with my study of medicine-men.

Ngonga, my interpreter and chief informant, was secured by Dr. Ennis to assist the investigation, and this he did with the greatest tact and ability. Ngonga speaks English, Portuguese, and Umbundu fluently. These accomplishments were so combined with a deep regard for the customs of his own people, the Ovimbundu, that he made an ideal interpreter.

From the base at Elende three journeys were made into the interior. The first of these led to the far south of Angola, among the Vakuanyama; a second journey took me into the Vasele country of northwest Angola; while the third and longest itinerary led as far east as Cangamba, a center of Vachokue culture, thence northward to Saurimo in Lunda.

At the end of each of these journeys, which totaled 5,000 miles, I returned to the base camp, developed photographs, shipped collections, and continued my studies among the Ovimbundu.

In the interior I received help from Mr. and Mrs. H. C. McDowell of Ngalandi, both of whom gave considerable aid in investigating initiation ceremonies for boys and girls, and in securing three medicine-men and a rain-maker to explain their vocations. At Bailundu Mr. G. M. Childs obtained many valuable objects relating to the medicine-man's work, and the worth of these was greatly enhanced by full descriptions, and translations of the Umbundu language in which the explanations were given.

Owing to the interest of Professor Edward Sapir, formerly of the University of Chicago, now at Yale, assistance in transcribing phonographic records of the Umbundu language was obtained. The phonetic transcriptions were made by Dr. M. H. Watkins and Mr. R. T. Clarke, whose expert aid was greatly appreciated. Records of drum music were transcribed by Dr. G. Herzog of the University of Chicago. Drawings of objects collected have been prepared by Mr. Carl F. Gronemann, Staff Illustrator of Field Museum.

This recognition of cooperation would be incomplete without gratefully remembering my servants, who shared the fatigue and hazards of the journey. Abilio Esteves proved to be a thoroughly competent guide and adviser. The servants aided in locating ceremonies, acquiring objects, and dealing with the tribes among whom the expedition passed.

WILFRID DYSON HAMBLY

# THE OVIMBUNDU OF ANGOLA

## I. INTRODUCTION

Research work among the Ovimbundu of Angola indicates the presence of numerous cultural traits revealing what are probably distinct stratifications of culture. These diverse elements have been welded together into a pattern, the examination of which constitutes the present problem.

The object of this study is an analysis of these traits with a view to showing the sequence in which they have been received, from whence they came, and the processes which have been responsible for coordinating them so as to form the present social system.

My presentation passes from geographical and historical considerations to an ethnological approach, locally applied in the first place for complete analysis of the culture of the Ovimbundu and surrounding peoples. The traits have to be considered singly and in combination. Then follows an examination of some of these traits which are widely distributed outside Angola. We next seek to ascertain the geographical origin of traits, their history, and the psychology of their combinations and assimilation into an aggregate. What elements have been acquired through adoption? And what has been the historical process? Which traits have arisen through independent invention? What factors have been discarded, and why? To what extent have the Ovimbundu utilized opportunities for enriching their culture, and what possibilities have been neglected?

What are the classes of evidence which might be expected to assist an inquiry into the growth of Umbundu culture?

Field work was of primary importance for obtaining a first hand knowledge of the tribal life of the Ovimbundu as it exists today, and in order to estimate the effects of cultural contacts extensive journeys were made to the north, east, and south of the central territory occupied by the Ovimbundu. The results of personal investigation are given in chapters IV-IX, dealing with the economic, social, and religious life of the Ovimbundu. These facts have been kept free from the observations of other investigators whose reports are summarized in chapter III, "Historical Sources."

Unfortunately there are no archaeological data which can assist a study of historical processes, for archaeology has not yet been approached in Angola.

Geographical study is valuable in showing that physical factors such as position, topography, soil, and climate have had not only a permissive but a stimulating effect on the development of certain cultural traits.

Historical documents dating from the year A.D. 1500 present valuable evidence for tribal movements, the effect of early European contacts, and the existence of certain beliefs and ceremonies. The facts adduced in chapter III are used in chapters X–XII in discussing culture contacts and cultural processes.

Inquiry respecting relationships of the Ovimbundu to other African tribes is aided by a study of the Umbundu language, which is shown to be of pure Bantu structure and vocabulary (chapter VIII). The characteristic features of the Umbundu language are those which form the basic elements of Bantu speech in general. These characteristics are alliterative concord (that is, repetition of the prefix before every word in agreement with the noun); absence of grammatical gender; and a position of the genitive in which the name of the thing possessed comes before the possessor. Umbundu, though structurally assignable to the Bantu group, has its own vocabulary, whose degree of relationship to that of surrounding peoples may to some extent be judged by the vocabularies of F. and W. Jaspert (*Die Völkerstämme Mittel Angolas*, Frankfurt, 1930, pp. 144–150). The fact that the language of the Ovimbundu has become the lingua franca of Angola, still further testifies to the thoroughness of the contacts, which from historical sources are known to have been made in the period 1500–1900.

The spelling of proper names leaves a wide margin for individual preference. The Umbundu language requires "M" before "B," yet custom has sanctioned the form Bailundu. Nevertheless I have retained "N" in Ngalangi despite the form Galangi on several maps. Maps show great diversity of spelling, but I have adhered throughout to Kipungo (Quipungo) and Kwanza (Quanza). Among tribal names I prefer Vakuanyama to OvaKwanyama and Vachokue to BaKioko or BaDjokue; in making the choice I have tried to imitate the sounds I heard from the natives themselves. In referring to the papers of E. Torday, who knew the southwest Congo well and spoke several Congo languages fluently, I note that he sometimes prefers to recognize the prefix as in BaMbala and BaYaka, but he also writes Badjokue and Bayaka. J. H. Weeks writes Bangala (BaNgala). C. H. L. Hahn uses the form Ovambo (OvaMbo). Ovimbundu I have preferred throughout; the accent is on the

penultimate syllable as is usual with Bantu words. The alternative form would be OviMbundu. Some writers hyphenate after a prefix. *Lu* is the plural prefix in the tribal names Luchazi, Luvando, Luena and Luimba. Ocivokue, Ocimbundu and Uluchazi are singulars. The word Umbundu is used adjectivally as well as for the name of the language.

Observations relating to the physical appearance of the Ovimbundu (chapter IV) deal with physique, dress, tooth mutilation, hair-dressing, scarification, and personal ornaments. The object of this chapter is to estimate the results of contacts so far as these affect the traits just mentioned.

Of great importance in an inquiry into the growth of Umbundu culture is the inferential testimony to be derived from ethnological study of surrounding tribes. This subject is considered in chapter X, "Culture Contacts," with special reference to the Congo basin, Rhodesia, and South West Africa, concerning which there exists an adequate and reliable literature.

In chapter XII, "Cultural Processes," ethnological facts derived from field work and historical sources have been combined with data relating to geography, physique, and language. This has been done in such a way as to present a hypothesis of cultural growth which is consonant with direct evidence and inferential testimony.

Finally, personal acquaintance with the daily life of the Ovimbundu is made the corner stone for behavioristic study. This is intended to explain the operation of social forces and controls in welding the tribal traits whose origin and assembly have been previously discussed.

Should my colleagues of the functional school contend that my approach is too static in its historical and anatomical method, I would reply that my research does at least lay a sure ethnological foundation for those psychological and sociological studies which are today rightly regarded as essential for the adjustment of relationships between Africans and their European administrators. The correlation of all aspects of tribal life, including culture contacts, cannot be too strongly stressed. The headings chosen for chapters are adopted merely for convenience of presentation. But an endeavor has been made throughout the book, and particularly in the final chapter, to emphasize the coordination of economics, social organization, education, language, and religion.

## II. GEOGRAPHICAL FACTORS

This chapter is intended to give an outline of the geographical conditions of Angola and to point out the way in which these have influenced the growth of Umbundu culture in all its aspects.

A presentation of geographical data is of primary importance here, and the actual relationship between the facts of geography and culture is a matter for gradual evaluation in the following chapters. The extent to which geographic determinism has entered into the cultural growth of the Ovimbundu is particularly well seen in chapter V, "Economic Life," which deals with industries, agriculture, domestic animals, fishing, and transport.

The area of Angola is a factor of importance, for the greater the extent of any country the more diversified will be the products and the cultural differences. This is particularly true if there are considerable differences in the elevation, because altitude modifies temperature and affects the distribution of rainfall.

Angola has an area of almost 500,000 square miles. The greatest length is a distance of about 900 miles from the river Congo in the north to the region of South West Africa. The greatest breadth is about 700 miles from the Atlantic Ocean on the west to the borders of the Rhodesian plateau in the east. This range over twelve degrees of latitude, from 5° S. to 17° S., in association with differences in altitude, have produced ecological regions which are described in the following paragraphs.

The northern part of Angola is ecologically a part of the Congo basin, with conditions of heat and moisture giving rise to a dense tropical flora. Owing to the presence of tsetse fly, the great heat, and the lack of open grasslands, such country is unsuited for the rearing of cattle, while agriculture, including cultivation of maize, is restricted to forest clearings. Manioc, palm trees, peanuts, and sweet potatoes are the chief products serviceable to man. This region was, according to the historical evidence of chapter III, the area in which the Ovimbundu moved before they entered the Benguela Highlands of central Angola. Parts of chapters III and X ("Historical Sources" and "Culture Contacts," respectively) are devoted to an analysis of the cultural factors of the Congo area from the year A.D. 1500 to the present day.

The central portion of Angola is the area most important in this research because it is the home of the Ovimbundu, whose cultural

growth is under examination. This central plateau, the Benguela Highlands, rises in places to a height of 6,000 feet, an altitude which reduces the heat of the tropics and so modifies the flora, discouraging some types of vegetation and encouraging others. Hostility of the highlands to palm trees and the banana is appropriately discussed when dealing with cultural losses; while the fostering effect of reduced temperature and the presence of wide expanses of open country on the growth of maize and the keeping of cattle is a cultural gain.

The prevailing rains of Angola are from the northeast to the southwest; consequently the high plateau intercepts rain clouds which give an annual fall of sixty inches. This adequate rainfall is another factor which has affected economic life, density of population, communal welfare, and powers of expansion.

The villages of the Ovimbundu are built on hillsides having a commanding view of the surrounding country. There is in the nature of the land a natural protection from enemies. In addition to this the Benguela Highlands are an admirable base from which expeditions both predatory and commercial might, and actually did set out eastward to the interior of Africa, and southwest to the cattle-keeping country.

It is important to note that this central plateau is the watershed for four large river systems; the Kwanza to the northwest; the Cunene to the southwest; the tributaries of the Kasai to the northeast; and the Zambezi and its affluents to the southeast. Fishing, with attendant beliefs of a ritualistic kind, is of local importance; so also is the making of canoes. Moreover, the river valleys have marked out a natural means of communication in several directions.

In connection with the river system the biological factor of the tsetse fly is important, because the presence of the fly locally discourages human habitation and prevents the keeping of cattle. The exact distribution of the fly is imperfectly known, but *Glossinia palpalis*, the cause of sleeping sickness in human beings, also *Glossinia morsitans*, which carries disease to cattle, are both present along the Kwanza and parts of the other rivers (J. C. B. Statham, Through Angola, p. 294).

The western coastal strip is a region of great aridity which has in some years no rainfall whatever, because the northeasterly rains have expended themselves on the high plateau. This region displays vegetation of the semi-desert type; namely, baobab trees, prickly acacias, euphorbias, and aloes. Population in this area is sparse, always nomadic, and in some places non-existent. The coastal strip

was at times traversed by the Ovimbundu who know of the sea and call it *kakunga*. Bihéan caravans crossed to the coast with slaves, as history shows, but the nature of the coastal strip marks it as a western barrier limiting the expansion of the Ovimbundu in that direction. The coast line itself is of the greatest moment in the consideration of historical factors. From Loanda, Benguela, and Mossamedes on the coast, the Portuguese penetrated the interior, so making contacts with the Ovimbundu to the encouragement of caravan trade. The importance of this European contact will be seen in subsequent chapters.

The south and southwest parts of Angola are of particular importance in studying the contacts of the Ovimbundu, but to give here the details of the wealthy cattle-keeping culture of these regions, which were accessible through peaceful proximity, trade, and occasional raiding, would be an anticipation of chapter X, "Culture Contacts." One topographical point is of primary importance; namely, the ease with which the Ovimbundu could descend from their strongholds to the low-lying land of the west and south, whereas the reverse journey is much more difficult for a people unaccustomed to manoeuvring and finding their way among hills.

Having described the northern, central, western, and southern areas, there remains only the eastern section to consider; this presents several features of peculiar geographical and ethnological interest. The eastern section of Angola is either slightly undulating or flat, the general characteristic is dryness, and vegetation is somewhat sparse though sufficient to shelter many kinds of antelope.

The major population is the Vachokue, a warlike, hunting people, who follow agricultural pursuits but slightly, and do not keep cattle. Examination of the literature describing early exploration indicates the truculent nature of these eastern people with whom caravans of Ovimbundu were in frequent conflict. Umbundu caravans crossed this country when making their way to Rhodesia, culture contacts with which are discussed in chapter X.

The results of contact of Ovimbundu and Vachokue tribes, so far as physical miscegenation is concerned, are mentioned in chapter IV, "Physical Appearance"; while the social effects of slavery resulting from hostilities are described in chapter VI, "Social Life."

Rhodesia is a cattle-raising country, but the hostility of the Vachokue, the great distance from central Angola to Rhodesia, and the general dryness of the country to be crossed, discourage the idea that the Ovimbundu obtained their cattle from Rhodesia. If it is

argued that the cattle might have been brought along the course of the Zambezi and Kwando there is the objection that there are here several tsetse fly belts. On the contrary, cattle-producing country in the southwest and south of Angola is far more accessible than the Rhodesian plateau.

In the south there is the cultural habit of digging wells, especially among the Vakuanyama; but the Vachokue have not developed this trait. The substrata underlying the sand of southern Angola hold water which serves through the dry season, a fact which is advantageously employed by the cattle-keepers. The Vachokue lack this well-digging habit, and, even if subsurface water were present, the transient Ovimbundu would have lacked opportunity to dig for it when passing through hostile country.

The acquisition of cattle by the Ovimbundu is of great importance, because it is concerned with the grafting of a series of pastoral traits on a culture in no way originally associated with pastoral pursuits. The truth of this will later be made clear by examination of historical and ethnological evidence.

Geographical considerations give a picture of the Ovimbundu situated in naturally fortified country from which they had access to four surrounding areas, whose cultural characters agree well with the determinism of topography and climate. The natural advantages of the central highlands, and the results of contact with each of the adjacent areas, are points which will be developed in appropriate sections throughout the ensuing chapters.

### III. HISTORICAL SOURCES

The object of this chapter is the presentation of a summary of literature relating to Angola from A.D. 1500 down to the present day. In this literature there may be accounts of the movements of tribes which will throw some light on the origin of the Ovimbundu, and the date of their migration into the Benguela Highlands. Present-day tradition of the Ovimbundu is unanimous in declaring that the tribe came from the northeast of its present locality, but some historical justification of this belief is desirable. The word Ovimbundu ("people of the fog") may refer to the heavy morning mists of highland regions, and there is the possibility that the Ovimbundu adopted this name when they settled on the high plateau.

If there is historical evidence in favor of the traditional home of the Ovimbundu being the region of the north and northeast of Angola, what was the ethnological background of these areas at the time when the Ovimbundu became detached from a matrix of northern Angolan tribes? In other words, what cultural factors are the Ovimbundu likely to have brought with them into the Benguela Highlands? The ultimate origin of these factors is a point which has not been neglected (chapter XI, "Wider Culture Contacts"), but for the moment the primary concern is the historical background of the Ovimbundu, with special reference to tribal movements and cultural traits.

As part of this historical inquiry, contacts of the Portuguese and the Ovimbundu are of importance. When and where did the Portuguese come into contact with the Ovimbundu and with what results to the indigenous culture?

Chapters IV-IX deal exclusively with my field work among the Ovimbundu in 1929. Therefore it is pertinent to ask to what extent the ethnological observations of travelers and early explorers will corroborate the information recorded in my own notes. Will there be contradiction or confirmation of personal observations? Possibly the ethnological notes obtained from historical sources will serve, not merely to corroborate my field work, but actually to extend the area of occurrence of important cultural traits which I noted in 1929.

The literature describing Angolan history and customs is here presented in the form of a chronological bibliography, which is annotated so as to emphasize points bearing on the purpose of this historical analysis. That there should be a fragmentary presentation of data is an inevitable consequence of the nature of the literature

itself. Observations have been made, not in a well-ordered time sequence, but at irregular intervals. Moreover, the writings of the majority of observers have not been undertaken with any specific ethnological purpose in view. Early explorers in particular were prone to intersperse historical and ethnological notes among a mass of descriptive material relating to incidents of travel, animal life, and meteorological observations.

At the conclusion of this chapter an effort is made to remedy the disjointed nature of the historical evidence. This object is achieved by summarizing the points which provide an answer to the queries brought forward in the opening paragraphs of this chapter respecting the origin and cultural background of the Ovimbundu.

The Portuguese entered the Congo in 1482 under the leadership of Diego Cão (E. G. Ravenstein, *The Voyages of Diego Cão*, *Geog. Journ.*, 1900, pp. 625-649) and from that time onward Portuguese influence of a political and religious kind was exerted along the course of the Congo. Gradually the Portuguese established themselves on the coast of Angola. Paolo Diaz founded Loanda in 1576, and about eleven years later built the fort of Benguela.

The year 1590 saw the Portuguese making war in the interior of Angola against the Jaggas, a northern tribe among whom Andrew Battell was held in honorable captivity as a leader against the Portuguese and all natives of northern Angola, who were exploited by the Jaggas. In 1645 another Portuguese punitive expedition penetrated the interior as far as Bailundu, the center from which the strongest caravans of Umbundu traders and slavers set out for central Africa.

Caconda in the southwest of Angola was founded in 1682, and a century later the coastal town of Mossamedes became a starting point from which early exploration penetrated the interior in search of the sources of the Cunene River. (For the details of Portuguese penetration of Angola see Bibliography: T. E. Bowditch; R. F. Burton; E. G. Ravenstein; T. Lewis.)

When the Portuguese landed at the mouth of the Congo at the close of the fifteenth century they came into contact with the kingdom of Congo, ruled with great pomp and ceremony at Ambassa, about 150 miles inland, and identical with the San Salvador of the Portuguese. The old kingdom of Congo was made up of six strong clans of whose rivalry the Portuguese took advantage to strengthen their own commercial and political position. The slave trade was considered to be as respectable as it was lucrative, and there is no doubt

that the Church participated actively (T. Lewis, *The Old Kingdom of Kongo*, *Geog. Journ.*, 1908, pp. 598-600).

Political influence of the Portuguese, working often through the agency of Jesuit priests, led to factions within the Congo Empire, and the resulting disturbances caused movements of peoples that affected the whole of northern Angola and the population of the Benguela Highlands.

Portuguese penetration of the hinterland of Angola, especially from Loanda to Bihé, was concerned with attempts to subjugate native tribes, the establishment of trading posts, and the encouragement of the slave trade (S. Marquardsen, *Angola*, 1928, pp. 6-10).

The value of the Portuguese as allies of Umbundu caravans from Bihé lay in their ability to supply guns and powder to their native henchmen, who gave something more than military service in return. In response to Portuguese demand for slaves and ivory, Umbundu caravans made long journeys into the Congo basin, Rhodesia, south and southwest Angola, and possibly across Africa to lakes Tanganyika and Nyasa. The arms supplied in exchange for ivory and slaves must have helped the Ovimbundu in all their predatory excursions.

Thus the Ovimbundu were, in the early centuries of contact with the Portuguese, invaders encouraged in the building up of their tribal life and resources. Never were the Portuguese strong enough completely to subjugate northern Angola. Relationships with natives, especially the Bihéan section of the Ovimbundu, were directed toward alliances on a commercial basis. The political result of this was a combination of the Portuguese and the stronger tribes for the exploitation of the weaker.

The historical ethnology of the southwest Congo is so complex that the elements are difficult to disentangle. The number of tribes concerned is great, and their movements are not easy to follow; but a gradual extension of people from the Congo in a southwesterly direction through Lunda to the Benguela Highlands (1600-1800) seems to be the summation of all the conflict. I regard the Ovimbundu as the most southerly branch of these mass movements, during which they received a discipline that enabled them to make their home in central Angola, despite opposition from the Portuguese and earlier arrivals.

For these conclusions reliance has been placed on the extensive field work and historical analyses of E. Torday and T. A. Joyce, whose "Notes on the Ethnography of the Bambala" (*J.R.A.I.*, XXXV, pp. 398-426) have proved of particular value in this connection.

The kernel of the migratory problem of the Ovimbundu is reached when Torday traces out the history of the Kimbundu, for the Kimbundu are present-day neighbors of the Ovimbundu, to whom they are closely allied in language and culture (*ovi* is a Bantu plural prefix, which was perhaps used to express the inclusion of Kimbundu and Babunda under the general name Ovimbundu).

Torday's sifting of the historical evidence results in the conclusion that the Kimbundu came from the northeast, fighting their way to the Luando. These Kimbundu divided, with civil war as a consequence. One section crossed the river Kwanza, south of which they specialized in agriculture after becoming sedentary. Their sub-chief they called the *Kalunga*, which is the present-day word used by the Ovimbundu in greeting their chiefs. Traditions of the Ovimbundu point to the northeast as a center from which they spread at least ten generations ago. The rise of the powerful kingdom of Lunda dates from the seventeenth century, and although the details of this concentration of power in northeast Angola are unknown the general effects are understood. There was a great displacement of tribes in a southerly and southwesterly direction. In connection with the suggestion that the Ovimbundu came from the northeast of Angola, there is the necessity for recording the absence of even a fragment of historical evidence or tribal tradition indicating that the Ovimbundu came from the south or the east of Angola.

Cultural affinities of the Ovimbundu with tribes of the southwest Congo in particular, and with western Bantu culture in general, strongly support the foregoing deductions from historical sources (chapter X).

There is a probability that tribal disturbances resulting from the rise of the Lunda Empire led to a spread of the Vachokue over eastern Angola. Some of the effects of this contact have already been mentioned in chapter II, where contacts of the Ovimbundu and the Vachokue were discussed. The journey brought me into contact with the Vachokue at Cangamba, Katoko, and Ngalangi, of which Cangamba is the most easterly.

Witnessing of initiation ceremonies combined with observation of physique, language, and artifacts, leads me to agree with Torday that Cangamba is probably the ancient center of Vachokue culture. As one proceeds from Cangamba westward this type of culture becomes thinner as the borders of the country occupied by the Ovimbundu are approached. On the border line between the cultures of the Vachokue and the Ovimbundu, notably at Ngongo near Ngalangi,

there is tribal and cultural miscegenation. Both Umbundu and Vachokue languages are spoken; boys of Ngalangi were seen to wear initiation costumes similar to those worn at Cangamba by the Vachokue, but on proceeding farther westward into territory exclusively occupied by the Ovimbundu, such initiation ceremonies are either absent or attenuated in ritual.

Elende, one center of research among the Ovimbundu, represents the purest Umbundu speech and culture observable at the present day. But in chapter IV some physical resemblance of the Ovimbundu to the Vachokue is noted. Warfare commonly resulted in the taking of slaves, a fact which might account for an apparent infusion of Vachokue blood in some of the Ovimbundu.

The historical data suggest a northern or northeastern starting point of Umbundu migrations. Therefore an inquiry into the ethnology of these areas will be useful in showing the kind of culture with which the Ovimbundu were in contact before their settlement in the Benguela Highlands. If historical sources disclose the nature of northern Angolan culture from the year A.D. 1500 onward, such evidence can then be considered in relation to cultural traits of the Ovimbundu at the present day.

The establishment of strong cultural resemblances between extant Umbundu culture and older cultural patterns of northern Angola, would tend to strengthen the evidence of history respecting the northern origin of the Ovimbundu.

The regions dealt with in the following summary of ethnological facts are the Cabinda Enclave to the north of the Congo estuary, the region of San Salvador, the hinterlands of Loanda and Benguela, and the area of northern Angola between Lat. 7° and 9° S. and Long. 13° to 22° E. This covers the whole area with which the Ovimbundu are likely to have been in contact before entering their present home.

My survey begins with the observations of Andrew Battell in 1596. His account deals mainly with the northwestern part of Angola, a country bordering on and actually including territory now occupied by the Ovimbundu, who in all probability came in contact with the Jaggas, whose habits of life are described by Battell.

Torday and Joyce identify the Jaggas with the present-day Bayaka, whose cultural resemblances to the Ovimbundu are examined later. In my opinion, the Jaggas correspond well with the Bihéan section of the Ovimbundu, an itinerant and exceedingly warlike people.

As early as 1600 there were cattle as far north as Benguela, and the Jaggas regarded these as a most valuable part of their plunder. Palms are a characteristic part of the vegetation of Angola north of the Benguela Highlands. Evidently the Jaggas moved extensively in northern Angola because they cut down palms for making wine (Battell, p. 30). The usual method is to tap the top of a standing tree, but the Jaggas were an itinerant people who did not cultivate palms.

Sprinkling the blood of sacrificed animals on a newly kindled fire I have mentioned in connection with Umbundu rites celebrating the founding of a new village. The Jaggas carried out this ceremony before a raiding expedition, when cows and other animals were sacrificed (Battell, p. 33). Battell mentions the use of red *tukula* wood for personal decoration. This wood (*Pterocarpus tinctorius*) is used in many parts of Angola at the present time.

Reference to Battell confirms the information given to me in relation to an old iron gong obtained at Ngalangi. He says (p. 20), "The general did strike his gong, which is an instrument of war that soundeth like a bell, and presently made an oration with a loud voice."

Battell reported that the Jaggas wore beads of ostrich eggshell. Ravenstein, the editor of this volume in the Hakluyt Series, seems to doubt this statement, saying, "There are no ostriches in Angola, and as to beads made of ostrich eggs I can give no explanation." I noted the presence of captive ostriches in southern Angola as far north as Gambos. The Vakuanyama women greatly value their long necklaces of ostrich-eggshell beads. Necklaces made in the north of Angola are traded to the south and conversely, each kind of necklace having a high value due to remoteness of origin. This instance, like many other points, confirms the reliability of Battell's observations in Angola.

Father Jerome Merolla (1682) describes the poison ordeal which was used from the Congo estuary to San Salvador (Churchills' Voyages, II, p. 675). "The aforesaid oath is administered to the supposed traitor by a sort of wizard, who, making a certain composition out of the juices of herbs, serpent's flesh, pulp of fruits, and divers other things, gives it to the supposed delinquent to drink. If guilty (as they tell you) he will immediately fall down in a swoon or trembling to the ground." The marimba was used, and a double iron gong was carried before a chief and struck by an attendant.

O. Dapper (Description de l'Afrique, 1732, p. 369) shows a scene in which an ax, such as I obtained from the Vasele country, is being used for beheading a slave.

Cavazzi (Istorica descrizione, etc., Bologna, 1687) describes the three kingdoms of Congo, Matamba, and northern Angola. The poison ordeal, the scapegoat, the blacksmith's bellows (pp. 101, 170) are all traits known to the Ovimbundu. The musical instrument made from a large gourd, which has a ridged board attached for rubbing with a stick, is the type I collected. Cavazzi pictures the double iron gong and the long drum held between the knees. He also shows a rain-maker (p. 214) and the sacrifice of two hundred victims at the accession of a king (p. 210).

Consideration of the history of maize in Africa is of importance in connection with these early writings, as this grain is the staple agricultural product of the Ovimbundu. I am indebted to Dr. Berthold Laufer for access to his unpublished research on this subject. From the following facts one may assume that, in all probability, the maize culture of the Ovimbundu was derived from the Congo region before their migration into the Benguela Highlands.

Father Jerome Merolla remarks that maize was growing in the neighborhood of San Salvador (1683-92). The native names were *mampunni* and *massambuta*; from this corn an alcoholic beverage was prepared. According to Cavazzi (Ehrmann, Geschichte der merkwürdigsten Reisen, XIII, 1794) maize was not intensively cultivated by the Negroes of lower Guinea, though it thrives well and may be harvested twice or thrice a year. The natives said that the grain was brought by the Portuguese, but they did not esteem it highly, and were accustomed to use it as food for pigs.

Bosman (p. 312) records that prior to the arrival of the Portuguese, Negroes were entirely ignorant of *milho* ("maize"). The account of Duarte Lopez preserved by Filippo Pigafetta states that the Negroes consider maize the vilest of all grains, so that it is given to swine. This contempt and lack of knowledge of the food value, combined with ignorance of methods of preparation, suggest a recent introduction (Pigafetta, translation by M. Hutchinson, 1881, p. 40). Dapper (Description de l'Afrique, 1732, p. 345) also mentions the cultivation of maize. Battell lived as prisoner in northern Angola about the year 1600, consequently his records of the use of the great Guinea wheat (maize), which the natives call *mas-importo*, give early evidence for the use of this grain (Hakluyt Soc., 1901, pp. 9, 11, 67).

The foregoing facts, when compared with field work among the Ovimbundu, indicate that the old culture of the Congo and northern Angola bears a strong resemblance to Umbundu culture at the present day. A more detailed analysis of this resemblance is made in chapter X.

The following notes dealing with exploration in Angola (1800-1930) are adduced for critical comparison with my own observations among the Ovimbundu.

The work of Sir R. F. Burton describing the exploration of Lacerda and other Portuguese pioneers, is more useful for geographical than for ethnological information. Lacerda's journey to Cزامbe, south of Lake Moero, was performed in 1798. A mention of veneration for the dead and consultation of the deceased on all occasions of war or of good fortune, is made (p. 127). These are important points in the present tribal life of the Ovimbundu.

Bowditch (1824) writes from information given to him by Almeida and Saldanha. There are valuable references to the Vacilenge, a people adjacent to the Ovimbundu, who refused to kill their cattle, "rather than do which they will endure famine to extremity." This note was made about Long. 15° E. and Lat. 15° S. (p. 34). The cattle were milked, and cattle-raiding by the Ovimbundu was common at this time. Many present-day Ovimbundu do not milk their cattle, but the Vacilenge still follow their milking custom observed before 1824.

Livingstone's journey through northeast and northern Angola in 1853 contains references to the Vachokue who seemed bent on plunder (I, p. 370). Livingstone noted cotton spinning, which I recorded as an occupation of males of the Ovimbundu at Elende. Livingstone, like other early travelers, encountered caravans of Bihéans (Ovimbundu) bearing elephants' tusks and beeswax, commodities, which, along with slaves, formed the chief merchandise of these caravans from the Benguela Highlands (p. 466). Livingstone notes and sketches (Plate XIII, Fig. 10) the double-handled hoe (p. 442) which is still used.

J. J. Monteiro (I, p. 61) saw the poison ordeal administered. The poison itself was prepared from the thick hard bark of a large tree (*Erythrophlaeum guineense*). The place of observation was Mongue Grande, just south of the Congo estuary, and again Monteiro was present when the poison cup was given to two women at Ambrizette. Of this ordeal there is more to be said when discussing the culture contacts of the Ovimbundu, because the ordeal is a basic factor of

wide distribution in Africa (C. Wiedemann, 1909) and the ceremony still survives among the Ovimbundu in modified form.

Though an informative writer, Monteiro is sometimes vague; he says (I, p. 278) that circumcision is a universal custom among the blacks of Angola. In view of the extent of Angola, the diversity of tribes, and the fact that Monteiro traveled over only a small part of the country, this information is misleading.

Monteiro is the only writer in whose works I have found a reference to the Vasele tribe; probably no part of Angola has been so neglected as the Esole country in the hinterland of Novo Redondo. At the present day the Vasele have a reputation for cannibalism. Monteiro saw human flesh eaten at Cuacra, while the skulls of the victims were placed on adjacent trees. Monteiro states (II, p. 167) that on the death of a king the Mucelis (Vasele) put out all the fires in the kingdom; these were relighted by the succeeding king who used fire produced by rubbing two sticks together. The flat beads of shell called *dongos*, made from *Achatina monetaria* (II, p. 168), are made today and traded to the far south of Angola, where their novelty assures them a value far beyond their intrinsic worth. I was fortunate in obtaining an example of the old beheading ax mentioned by Monteiro (II, p. 157) and sketched by Cavazzi (p. 210). Par-boiled and roasted rats were offered to me as food; Monteiro mentions the offering of a roasted rat on a skewer (I, p. 99).

The account of Commander V. L. Cameron, who left Zanzibar for his journey across Africa in 1873, mentions several points of anthropological importance in relation to the Angolan section of his journey. Cameron saw a net-covered medicine-man of the Kibokue (Vachokue) wearing a mask and a kilt of grass (p. 384). The function of this man was to frighten devils from the woods. The contest in which boys discharge their arrows at a rolling root was seen by Cameron near Kagnombe (Cangamba?). Skulls of victims killed in war were spiked on poles (p. 399). The diviner was followed by attendants who struck iron gongs, while the diviner himself shook a rattle made of basket-work in the form of a dumb-bell (p. 404). Cameron gives an accurate description of the divination basket and its use without going into details. These I have been able to supply (chapter IX). The explorer met caravans of Bihéans, renowned carriers then as they are today. They were usually drunk and abusive; in some instances they attempted to rob the stragglers. The use of caterpillars as food is noted (p. 416): "A man cut open

a large cocoon, extracted the contents, and smacked his lips with great gusto." My field notes mention the use of caterpillars as food.

Capello and Ivens (1877-80) remark on the burial places of hunters which are distinguishable by the skulls of antelopes, buffalo, and hippopotamuses, stuck on upright poles, mixed with skulls of oxen killed in honor of the defunct. The writers noted that a heap of stones protected the body. I photographed two types of cairn in the regions of Ganda and Luimbale respectively. Capello and Ivens are not precise in their locality, but I judge it to have been Long. 17° E. and Lat. 13° S., a considerable distance from my own observations (Plates XXXII, Fig. 1; LXXIV, Fig. 1).

I photographed the stilt-walkers at the final stages of the initiation ceremonies at Cangamba. These men had no costumes; on the contrary they were almost naked but were covered with white clay. Capello and Ivens (p. 295), saw a stilt-walker with a feathered mask and a netting costume. Such attire I saw on an Uluchazi medicine-man, but not on the stilt-walkers (Plate LXXXI, Figs. 1, 2).

I was unable to obtain information about the stilt-walkers, but Capello states that they castigated misdemeanants, punished shameless women, and accused criminals. Capello and Ivens were 187 miles to the northwest of my area of observation. The Uluchazi medicine-man, who appeared with the stilt-walkers during my visits, was said to make bad magic for women. The men ignored him but women gathered round in a derisive way; they quickly scattered when he pursued them.

Serpa Pinto, who made his journey across Angola in 1878, has so many references to customs and objects still extant, that I propose to tabulate his observations because of their value in showing the preservation of indigenous traits in spite of Portuguese contacts.

The body of a chief is buried with a covering of oxhide. Many oxen are sacrificed at the death of a king. The heir to the deceased is bound to sacrifice his whole herd in order to regale his people and give peace to the departed (S. Pinto, I, p. 63). The Ovimbundu conform at the present time to similar methods of burial and sacrifice.

Near Huambo, Serpa Pinto saw in every village a kind of "temple for conversation." This is the *onjango*, that I have described and photographed (Plate XLVIII, Fig. 1). It is the house in which all males foregather for the evening meal, which is brought by their women (I, p. 96).

The gathering and eating of caterpillars is described. This continues today (I, p. 120).

Serpa Pinto saw shafts for the working of iron ore in the neighborhood of Cubango. The ore was mixed with charcoal and smelted in shallow pits. It is stated that the iron was sometimes tempered with ox-grease and salt. The bellows are of the type made at Elende (I, p. 128). Of the tempering process I have no confirmation.

Somewhere near Bihé Serpa Pinto saw the ceremony of questioning a corpse which was made to sway to and fro, the people believing all the while that it does so without human intervention. The diviner declared that the soul of a dead person will tell who caused the death (I, p. 130). I observed and photographed this ceremony (Plate XLV, Fig. 1).

The ordeal of the poison cup is described; blood-letting, and divination by shaking articles in a basket are also mentioned. Pinto says that in the articles that appear uppermost the diviner reads what his hearers are desirous of learning of the past, present, or future. Sorcery and rain-making are likewise briefly mentioned (I, p. 132). The divination basket, the poison ordeal, and rain-making, are Umbundu cultural traits today.

Here Pinto illustrates the existing practice of mounting the skulls of animals killed by a hunter on a pole in the village. There is a further reference to this custom among the Ambuellas (I, p. 333). These instances, combined with those personally noted, give a wide distribution for the practice (I, p. 177).

Pinto saw the operation of tooth mutilation among the Luimba. The operation was performed with a knife which was struck by repeated light blows (I, p. 209).

Pinto illustrates arrowheads in use in 1879 (I, pp. 277, 346). These are exactly the same as those made and used in 1929 (Plate XVII, Figs. 1-9).

Axes used by the Luchazi are sketched with a detail that shows the old forms to persist without alteration (II, p. 36).

Water-pipes made from horns and gourds by the Luina of eastern Angola are of the forms now used in that region, also by the Ovimbundu of the present day (II, pp. 33, 37).

For use in checking and supplementing my observations Serpa Pinto's book was found to be of the greatest service, though the precise locality was sometimes difficult to identify. This explorer, in common with others, scattered his ethnological observations among descriptions of the route and botanical, zoological, and other notes.

Lux traveled from Loanda due east, following the Kwanza on the northern bank between 9° and 10° S. Lat., and so into Lunda.

He draws the crescentic arrowhead (p. 123) still common among the Ovimbundu and Vachokue; the double iron gong (p. 122); and the musical bow, which he calls a viola (p. 121).

Sogaur states that iron-working had an advanced technique at Dindo, more than half a century ago. According to Sogaur, the blacksmith was using scrap iron from European sources (II, p. 14).

Perhaps the most valuable of Chatelain's books is "Fifty Folk Tales of Angola." The stories are accompanied by translations and ethnological notes, the most important of which are references to the carrying of a corpse on a pole; the building of a cairn of stones over the corpse of a hunter; matrilineal descent and the power of the maternal uncle over the persons of his nieces and nephews (sisters' children). My observations included some details respecting the pawning of a sister's children to redeem the debts of their mother's brother. Chatelain adds that sisters' children are successors to private property and chieftainship (pp. 8-10). My notes agree that property is inherited by children of a deceased man's sister, but my informants said that a new chieftain is normally the eldest son of the principal wife of the dead chief. Chatelain's folklore stories, fifty in number, relate chiefly to animals; this was the only kind of story told to me, but W. C. Bell has recorded a few tales of another type.

Marquardsen (1928) devotes only one-fourth of his book to the ethnology of Angola, which he treats in a very general way; there is no section dealing specifically with any particular tribe. The author calls attention to Chapman's observation of rock paintings of South African Bushman type, between Cuma and Luimbale in northwest Angola. I have elsewhere remarked on the occasional occurrence of physical types which show a strain of Bushman blood. Today Bushmen penetrate southern Angola from the Kalahari (Plate LXIX, Figs. 1, 2), but their presence in times past or present does not affect the course of history or the data of ethnology to an appreciable extent.

Marquardsen gives some notes of a general kind on Vaheneca, Mahuila and other tribes of southwest Angola. The suggestion is feasible that the Umbundu name Suku, for a supreme being, is the same as the Nzambi of Lunda and the Congo. Marquardsen refers to the importance of the maternal uncle in Umbundu society, to the poison ordeal, and to the burial of an Umbundu chief in oxhide, all of which points were recorded in my observations at Elende.

Ferreira Diniz's book is unobtainable, but, judging from the summary given in *Anthropos* (XX, 1925, pp. 321-331), the information was collected by a questionnaire widely distributed among adminis-

trative posts. I agree that people between Caconda and Huila represent a racial mixture of the Ovimbundu and the Ovambo. The record speaks of painting-houses for girls at Cabinda, an item which agrees with reports from other sources. The jottings concerning tribes from Cabinda to the far south of Angola are too vague to be used in ethnological work with confidence.

There are many points on which the work of A. Schachtzabel should be consulted for the purpose of making comparisons with my own observations. The chief of these are a note and photograph on village construction (p. 130); the musical bow (p. 32); the loom (plate VI); transmigration of the soul of a chief into an animal (p. 51); and the game of mancala (p. 52). My observations of initiation at Katoko, Ngalangi, and Cangamba agree well with that of Schachtzabel at Katoko, but I was able to obtain more detail and more numerous photographs of the ritual of initiation. The spinning of cotton (p. 143) is exactly the process so frequently witnessed now at Elende. Iron-working (p. 111) appears to be comparable with the technique at Elende, but Schachtzabel seems to have missed the ritual. I was not so fortunate as this author in finding the old type of iron-smelting furnace in use.

The work of Statham is devoted primarily to hunting and descriptions of plant and animal life. The chapter given to a casual description of people among whom he passed is not useful as ethnology; but the book is of service in providing a background of natural history. Information on the tsetse fly in Angola (p. 294) assists ethnological work by showing the determining effect of this biological factor. Presence of the fly is prohibitive to cattle-keeping, therefore cattle are not kept along the river courses which are infested with this pest.

Alexander Barns made no pretence of writing more than a travel book; nevertheless he publishes photographs of ethnological value, gives useful historical summaries, and deals with economic problems of production and transportation.

Tucker's book "Drums in the Darkness," though written to interest the American public in mission work, contains many ethnological statements. The chief of these relate to the structure of the compound (p. 37); the dress of women (p. 39); naming of twins and triplets; and other items which agree well with data from the district in which I worked. There are notes on drum signals (p. 74) and cannibalism (p. 77). Apparently drum signals were in use at Bihé half a century ago. Forty years ago a slave was killed and eaten at the installation ceremonies for a new king, a point that was noted

in the works of Battell, Cavazzi, and other early writers. A description of the whipping of boys at initiation (p. 99) agrees with my own records, but details of the period and place are not given by Tucker. Questioning a corpse (p. 102) is a ceremony I have witnessed and described, but the instance referred to by Tucker relates to the interrogation of the corpse of a chief with regard to his choice of a successor; there are laws of succession, but these may be waived. The ceremony described in my monograph was conducted to discover the cause of death and not to determine succession. If Tucker has any detailed information with regard to puberty ceremonies for girls his reticence is regrettable (p. 142). Tucker says that suicide among women is common (p. 143). A mention of *ocisunji*, a feast for spirits at which meat is offered to idols, is interesting (p. 168) but details are lacking, and the use of the word idols is ambiguous. The information respecting use of charms is corroborative of my own observations in two other centers, Elende and Ngalangi.

The most recent publication on the ethnology of Angola is that of F. and W. Jaspert of the Städtisches Völkermuseum, Frankfurt, 1930. Their journey was undertaken primarily to make collections for a museum, but linguistic and ethnological information was recorded among several tribes, notably the Kimbundu, Vachokue, Luchazi, Luimba, and Kusongo. The farthest point attained in a southerly direction was just north of Kipungo, and the general line of march was from Benguela to the northeast, into Lunda. There is very little overlapping in the work of the Jasperts and myself. My itinerary took me to the extreme south into the Vakwanyama country, and to the far east of Moxico among the Vachokue.

My work is presented as a monograph on the Ovimbundu only, and of their culture I treat exclusively, with some reference to the culture contacts observed on all sides of them. The Jasperts do not give an entire section to any one tribe; but combine their information respecting the tribes in a concurrent way, under such subjects as technology, language, and art.

If the sections relating to history and languages are excluded there remain a hundred pages, only one-sixth of which refer to the Ovimbundu; but there is a difficulty in reading through the book without being confused as to the tribe and exact locality under discussion.

The pages devoted to a comparative vocabulary form an important part of the work, and one which I barely touched, though I prepared an outline of Umbundu grammar and made dictaphone records of the

Umbundu language. The illustrations in photogravure are excellent, but the small-scale map is difficult to follow.

As might be expected in a work covering an enormous tract of country, the information is of a very general kind; I have nowhere been able to check in any detail on my own observations. F. and W. Jaspert recognize that Umbundu culture is primarily based on agriculture, maize being the most important crop, but they do not admit the importance of hunting (p. 16).

I saw many successful parties of Umbundu hunters, tested their precision with the bow and arrow, and was able to record the ritual connected with the initiation of a professional hunter. There is also a ceremony before the hunter sets out. It would be more accurate to say that, although Umbundu culture is based primarily on agriculture, hunting still retains some of its earlier importance.

The diagrams of houses in different parts of Angola are a useful feature of the work. I made many photographs but did not record details of planning.

The masks I obtained are exactly like those pictured, but my observations were carried out a long way to the southeast of the point where the Jasperts touched the Vachokue culture. I do not understand from their description whether the writers saw an initiation ceremony. They state that boys are circumcised and girls are excised when very young, even at the age of five or six years. I observed initiation camps and dances at three centers, Ngalangi, Katoko, and Cangamba; the last named is the main center of Vachokue culture. The male novices varied in age from twelve to sixteen years hence they were older than the novices mentioned by the Jasperts. I was informed that there were no excision operations for girls, though at Ngalangi, Vanyemba girls were secluded in the bush during initiation rites lasting for a month.

Bibliographical references to the research of H. Baumann will be found useful for comparative study. His detailed record of initiation among the Vachokue is valuable as a check on my observation, as we worked independently in areas separated by several hundred miles.

Consultation of historical sources gives the following answers to questions which were asked as an introduction to this chapter.

On the grounds of tribal tradition, historical evidence, and cultural affinities, the original home of the Ovimbundu was likely to have been in the southwest Congo. The Ovimbundu undoubtedly possess important cultural traits that have been characteristic of the southern Congo region from the earliest time for which a record exists.

In northern Angola the Ovimbundu could not have had other than a warlike existence, which trained them in military tactics and the building up of an aggressive confederacy. In this they were aided by contact with the Portuguese, who supplied guns and powder in exchange for slaves and ivory from the interior. This accumulated wealth further stimulated the building up of Umbundu tribal life.

Introduction of maize by the Portuguese gave the Ovimbundu a knowledge of this grain, which later became their staple wealth and food supply.

The cultural pattern of the northern Congo was the same in the year 1600 as it is today, and consideration of the ethnology of the Congo region reveals numerous similarities with Umbundu culture of the present time.

Writings of explorers in Angola from A.D. 1800 to the present day bring out many points which are in agreement with my field observations. There are no discrepancies which would make me question the validity of information given by my informants.

In early records, Battell's observation of cattle in the hinterland of Benguela (1600), is important in showing that at such an early date the Ovimbundu had access to cattle when raiding from their home in the Benguela Highlands.

From these fundamentals of geography and history the inquiry turns to a detailed account of my observations among the Ovimbundu and surrounding tribes.

#### IV. PHYSICAL APPEARANCE

Among the Ovimbundu there are two main physical types. One of these is of brown skin color and slender build. In this type the calves and thighs are poorly developed, and the chest girth is slender in keeping with the general development. In general the physical characteristics are distinctly different from those of a typical West African Negro as represented by the Kru and the Ibo tribes: -

The Ovimbundu are Bantu Negroes who possibly result from a crossing of Hamites and true Negroes, a hypothesis which would account for both the light-colored slim type and the shorter, darker, more sturdy type. But E. Torday (Herbert Spencer, *Descriptive Sociology of African Races*, London, 1930, Preface, p. iii) thinks that differences of physique among Sudanic and Bantu Negroes are sufficiently accounted for by isolations and environmental differences. Torday denies the need for postulating an infusion of Hamitic blood, but his opinion is opposed to that which has found general acceptance.

The darker Ovimbundu with more facial hair may represent an infusion of Vachokue blood because there was warfare between the Ovimbundu and the Vachokue of eastern Angola with the result that some of the latter were taken as slaves. Types of the Ovimbundu are shown (Plates LII-LIV).

The Vasele, an Umbundu-speaking people of west-central Angola, form a linguistic and cultural pocket because of their isolation in rugged country. Their physique shows no pronounced differences from that of the Ovimbundu, but the methods of scarification, tooth mutilation, and personal ornament are in distinct contrast with those of the Ovimbundu. The Ovimbundu have only a V-shaped notch in the two upper central incisors, whereas the Vasele chip all their teeth to points (Plate LXXVI, Figs. 1, 2).

The Luvando of southwest Angola resemble the Ovimbundu in general physique, though the great difference in hairdressing and personal ornament is likely to give a contrary impression (Plate LIX, Figs. 1, 2).

The Vaheneca are particularly well developed (Plate LXII, Figs. 1, 2). Not until Mongua is reached does one find a people who are distinctly different from the Ovimbundu in all respects. The Vakuanyama of Mongua are noticeably tall and slim, much taller and slimmer than the Ovimbundu, while their physiognomy is more refined (Plates LXIII; LXVIII, Fig. 2). The Vakuanyama are a pastoral tribe whereas the Ovimbundu are principally agricultural.

The picture of types gathered at Ngalangi (Plate LXXXIX, Fig. 3) shows, reading from left to right along the back row, then along the front row in the same direction: an Ocimbundu; an Ocivokue; a man of the Vangangella; an Uhuchazi woman; a Lunda man; and two types of the Vangangella.

The M'Bunda man and woman photographed at Cangamba display characteristic deformation of the upper central incisors (Plate XCI, Figs. 1, 2). Photographs of a Mussurongo man and two women, taken about a hundred miles east of Malange, show no great difference from the Ovimbundu except in their shorter stature (Plates LXX, Figs. 1, 2; LXXI, Figs. 1, 2). The Bushman (Plate LXIX, Figs. 1, 2) shows a type found wandering in small bands in the south of Angola. These photographs were taken at Cassanga.

The dress and personal ornaments of the tribes dwelling to the south of the Ovimbundu (Plates LIX–LXVIII) are entirely different from the clothing and decorative styles observed in the areas occupied by the Ovimbundu. This statement is true with regard to bodily covering, ornaments, tooth mutilation, use of pigment, scarification, and hairdressing.

In respect of all these factors, males and females of the Ovimbundu have distinctive patterns which do not appear to have influenced, or to have been influenced by the styles around them.

In working southward from Elende I passed through typical Umbundu cultures until the vicinity of Kipungo was reached. At this place the change in physical appearance, ornaments, and hairdressing was remarkable both for its abruptness and distinctiveness. But the change from agricultural to pastoral pursuits is gradual.

A comparison of photographs indicates at once the truth of this statement, which can be further illustrated by a detailed description of the ornaments observed from Kipungo to Mongua.

By far the most important of these is the circular *omba* shell made from the basal part of a gastropod shell of the genus *Conus* Linn; and allied forms. These are highly prized, not because of any intrinsic worth, but on account of strong sentiment arising from their bequest, which is usually in the female line. I have, however, seen a few males of the Vakuanyama wearing these shells. For the old *omba* shells monetary offers equal to the earnings of a woman for a period of six months were made, but without success. One woman wavered somewhat, but finally decided that she dared not return to her home without her *omba* shells. From a Portuguese trader I bought, for a small sum, *omba* shells showing stages in manufacture.

The new ornaments had acquired no sentimental value, therefore their price was moderate.

*Omba* shells are to be seen in use from Kipungo southward through Huila, among the Luvando, and among the Vakuanyama of southern Angola. In the places mentioned one may judge the social status of a woman by the number of *omba* shells she wears. A principal wife is usually well supplied with these ornaments.

In this southern journey it was noticeable that there was an increasing use of red pigment which is lavishly employed for smearing every kind of ornament, the body, and the hair. Leather belts and skirts of Vakuanyama women are thickly coated with red pigment which is invariably mixed with grease. The red powder is prepared by desiccating a red wood called *tukula* by the Vakuanyama, a name which is used through Angola and the southern Congo area.

From Kipungo southward through the Vakuanyama country there is a notable absence of decorative wooden hair combs. On the contrary, delicately carved combs are used by both men and women of the Ovimbundu. The Vasele make such combs, but by far the best examples are made and used by the Vachokue tribe of eastern Angola. Here the decorative design usually includes a well-carved human figure at the top of the comb.

Among the Vakuanyama, necklaces of disks made from ostrich eggshell are worn by the women only. A woman of importance has a dozen loops of such necklaces, each loop being about 125 cm long. These necklaces are so greatly esteemed that only after much persuasion can a woman be induced to part with a single link. Perhaps, as is the case with *omba* shell, there is more than the intrinsic value to be considered. One point is constantly noticed in considering social status and ornament. All the wives of a wealthy man, especially among the Vakuanyama, are made to advertise their husband's position by the profusion of their ornaments and the quality of their leather skirts and belts.

There is, in addition to the necklaces of ostrich-eggshell beads, a highly prized necklace made from small perforated disks of shell having a diameter of about a centimeter. The Vakuanyama women smear a necklace of this kind with grease and *tukula* powder; the value of a necklace 125 cm long is equivalent to that of an ox. In describing these necklaces there is interest in noting that they are traded to the south of Angola from places six hundred miles to the north; therefore their value is to some extent dependent on rarity and distant origin.

Young unmarried girls of the Luvando tribe wear a large number of leg-bands which extend from the ankles to the knees as a sign that puberty has not been reached. These leg-bands are somewhat roughly twisted from fibrous roots and twigs from which the cortex has been removed. Collars of tough, elastic, cane-like substance are worn by Luvando women, and so numerous are these that the neck is entirely covered. These cane neck-bands are ornamented with burned, incised, geometrical patterns, and, in keeping with other ornaments, are thickly smeared with grease and red powder from *tukula* wood (Plate LIX, Figs. 1, 2).

Women of the Vakipungo and Vakuanyama wear heavy coils of brass or copper wire on their forearms. In southern Angola women wear bracelets of twisted wire which are identical with those worn by Zulu women. Bracelets of beaten trade brass, ornamented with incised geometrical designs, are worn by women of the Ovimbundu, Vakuanyama, Luvando, and Vakipungo tribes. Ovimbundu women now depend largely on trade goods for personal ornament.

Ovimbundu men and women are dressed in trade cloth. Unmarried girls wear one piece of cloth which hangs from the armpits to the knees. A married woman drapes herself with two pieces of cloth, a skirt hanging from her girdle, and an upper piece so folded as to hold her baby tightly to her back. Men wear a single piece of cloth as a skirt; the upper part of the body is bare (Plates XLIX-LI). From the region of Kipungo to the southern border, clothing is of leather. The Vachokue wear trade cloth or bark cloth.

Hairdressing is of many styles. Ovimbundu women braid their hair neatly in strands across their foreheads, and small blue and white trade beads are used to decorate the braids. The hairdressing of the Ovimbundu women is different from that in any other part of Angola. At an early age the hair is trained into two long loops at the back of the head. Then these are covered with black cloth which is bound tightly. The two loops are afterwards studded with brass-headed tacks obtained from a store (Plate XL, Fig. 3).

Luvando women in the region of Kipungo dress the hair to form a large triangular projection from the back of the head. Girls of the Vaheneca tribe near Huila mass the hair with clay to form large "cock's combs." Women of Gambos pass each small plait of hair through hollow reeds. Humbe women do not redden or grease their hair which is massed into three high ridges on the top, while at the sides there are hornlike projections. Vakuanyama women dress their hair with grease and *tukula* powder. A principal wife builds up her

hair into five high cones. Vachokue women mass their hair into separate balls shaped and held by clay and red coloring matter. I know of no hairdressing for Vachokue men, but ornamental wooden combs are sometimes used.

In only one place have I seen a nose pin worn, namely, the Esee country of Vila Nova de Selles. The fashion is out of date, but women of only twenty-five years of age have the septum of the nose bored; evidently the custom has not been obsolete for a long period (Plate LXXV, Fig. 1).

The most popular European importations are blue cloth with white spots, metal hair combs, beads, and bright metal crosses bearing a figure of the Virgin Mary with the infant Jesus. This ornament has penetrated to districts far away from Christian missions, and its wide dispersal shows that a newly introduced and attractive ornament from a foreign source may readily be accepted by tribes of different cultures.

There are interesting points of psychology in the attitude of the Ovimbundu toward European importations. Only a few patterns of cloth are favored, and there is no sale for any other design. Some designs are thought to be appropriate for young girls while others are favored by older women. The same may be said of colored beads, for whereas both blue and white beads are the usual decoration for young women and immature girls, red beads are worn chiefly by the elderly women.

A consideration of personal ornament establishes the general truth that in scarification, hairdressing, tooth mutilation, the use of red powder and grease, the anointing of the hair with palm oil, and the wearing of trade cloth, leather, or bark cloth, there is little exchange of styles. There are diffusions in language and other cultural traits, but decorative elements which have for a long period been regarded as distinctive of tribal life are rigidly preserved.

## V. ECONOMIC LIFE

The words "economic life" are here used with a wide connotation including nature lore, food supply, trade, transport, and industries; all these are combined to form a foundation for every aspect of the social life of the tribe.

The truth of this is realized if one pays attention to the rites connected with occupations. For the hunter there is special training, ritual, and a peculiar mode of burial. Final ceremonies in the initiation of a young blacksmith are associated with sacred acts such as sacrifice of animals and the sprinkling of the tools with their blood. Even the simple occupation of pounding corn requires that the rock shall be dedicated to this purpose by sprinkling the blood of a chicken on the surface. Similarly, a clay pit has to be consecrated before the raw material may be taken for making pottery. A caravan journey is not merely a commercial undertaking; the accompanying medicine-man carries a wooden figure which he consults with regard to the route (Plate XXI, Fig. 5).

Division of labor according to sex is one of the most important principles involved in the economic life, more particularly in occupational groupings, which are strictly observed. Moreover, within any one activity, such as house-building, there are tasks for men only, while other parts of the work are performed exclusively by women or children.

The study of industries is of great importance when a comparison of Umbundu and adjacent cultures is being made. This is particularly true in the instance of wood-carving, an occupation yielding highly specialized products some of which are connected with religious belief and ritual. All artifacts are valuable as criteria of cultural contacts, though their reliability as evidence of trait diffusion naturally varies with their degree of complexity. Study of native industries in relation to European contacts illustrates a cultural process which may result in acceptance, rejection, or ingenious adaptation of new ideas.

That a study of the economic life of a tribe is not merely a recording of material processes and artifacts, is illustrated by observation of the treatment of cattle. This pastoral pursuit naturally falls under a heading "Domestic Animals," but the ideas associated with cattle, including funeral feasts, use of horns on graves, and the wrapping of the royal corpse in oxhide, lead directly into important matters of belief and ritual.

Nature lore of the Ovimbundu rightly forms an introduction to other aspects of economic life, because there is no better introduction to ethnological research in the field than that of associating with the people in daily occupations connected with the food supply and industries. In this way a field worker realizes that observation on the part of hunters and food gatherers is fundamental, not merely to economic and social life, but to the growth of language and folklore.

Observation and experiment have led to the selection of many kinds of timber, each having one or more specific uses. Collection of plants is connected with the making of dyes for baskets, a varnish for pots, and a pharmacopoeia for the medicine-man. Minute observation of the habits of animals, primarily carried out to ensure successful hunting, is clearly reflected in the growth of vocabulary, and likewise in the realism and humor of folk tales and proverbs (chapter VIII).

This chapter is concerned chiefly with a presentation of factual material whose psychological and cultural bearing is more fully dealt with in chapters X-XII.

#### NATURE LORE

The Ovimbundu are keen observers whose knowledge of the natural history of plants and animals is comprehensive. Almost any boy of twelve years of age is able to give the information detailed here. Some of the birds have been identified by Mr. Rudyerd Boulton, Department of Zoology, Field Museum.

*Ombo*. Ostrich. The knowledge of this bird must come from the south of Angola. In traveling south I first saw ostriches at Humbe. These were domesticated birds.

*Epanda*. Wattled Crane (*Bugeranus carunculatus*). The informant said, "Epanda is a big bird which has long legs and a long neck."

*Epumumu*. This is the Ground Hornbill (*Bucorvus cafer*) whose black wings are tipped with white. I have observed them from Ganda to Vakuanyama country. They take to flight slowly after hopping heavily for a few paces.

*Ocamukongo*. From the Umbundu word *ukongo*, a hunter. This bird lives on small buck and rabbits.

*Etokailo*. This is the smaller bustard called by the Boers *knorhaan*.

*Ohanga*. The Guinea Fowl (*Numida meleagris*).

*Onjawa*. Spur-winged Goose (*Plectropterus gambensis*).

*Ongonga*. An eagle. The word is used generally for a large bird of prey.

*Ohokohoko*. The Bateleur Eagle (*Terathopius ecaudatus*). The bird is almost without a tail. This bird is not predatory. It kills snakes but does not take chickens or other small animals.

*Ociselele*. A kite, well known because it preys on chickens.

*Etalahanga*. A hawk which waits in the trees then volplanes on its prey.

*Okapamba*. A small hawk which preys on chickens.

*Enyamahuti*. A hawk.

*Ocikuamanga*. The White-breasted Crow (*Cornus albus*).

*Onquali (ua-wa)*. This is the Red-necked Partridge (*Pternistis afer*).

- Ekalanga*. A species of francolin without red coloring on the legs.
- Esuvi*. This is a bird which comes out at night. It can catch spirits and make them die a second death.
- Onjimbi*. This nocturnal owl (*Bubo maculosus*) is thought to be very dangerous. People who hear the cry of this bird are frightened because the noise is the sound of death.
- Kacukucuku*. The Barn Owl (*Tyto alba affinis*).
- Ongongayulombo*. An eagle which eats small buck, pigs, and rabbits.
- Ekuti*. Is a Red-eyed Dove (*Streptopelia semitorquata*) which says "oo--oo--oo" very sharply all day.
- Onende*. A dove (*Streptopelia capicola*) which makes the same noise as *ekuti* but on a higher note.
- Onduwa*. This bird is of great importance to the Ovimbundu, because the feathers are used for decorating the head of a dead king. A medicine-man sometimes uses them for decoration when he is performing.
- Ondonga*. Is a little bird, which, like *onduwa*, belongs to the royal family of birds.
- Ukuku*. A water bird.
- Ocisandombunji*. This is a bird which feeds on white ants.
- Epandacokocoko*. This is a bird (*Geocichla lissipirupa*) whose cry tells the people of a village to make the guest house ready as strangers are coming.
- Ocilonga*. Is a beautiful yellow bird, an oriole (*Oriolus monarchus angolensis*).
- Ethua*, singular; *ovatus*, plural. A species of bustard.
- Etioko*. A small bird of the plains (*Anthus leucophrys*).
- Okakelekele*. This is the Spur-wing Plover (*Hoplopterus armatus*), a large bird which lives on flat land near rivers.
- Ocikandi*. An unidentified bird. My informant said, "*Ocikandi* can cry in the same way as any other bird."
- Okakongonyala*. This is a bird somewhat like a pigeon but larger. It has long legs and is able to run well.
- Undolo*. A small spotted bird which always looks in the direction of the sun.
- Omiapia*. This is a swallow.
- Ocikungumiapia*. My informant said, "This bird is like *omiapia* but larger."
- Omuipui*. "He has a crest on his head and when he sings rain is coming."
- Esunguaguluve*. This bird has a long beak. It lays eggs on the ground. The bird is as big as a man's fist.
- Omanula*. A woodpecker (family Picidae).
- Okangongo*. Has a white breast spotted with black; the head is blue.
- Ocinjonjo*. This is a little bird having a long beak which is used to probe into flowers.
- Koseselekele*. A little black bird which makes a small fine nest.
- Ocituku*. A river bird. These birds go about in flocks.
- Ongombo*. A small yellow bird.
- Epilili*. A yellow bird rather larger than *ongombo*. This bird is kept in cages very cleverly made of reeds by small boys. The birds are caught by smearing a sticky substance on the branches of trees.
- Ocikenge*. *Agapornis roseicollis*. A small green parrot.
- Okalusondonjovo*. Is to be seen at the time of *onjovo* (spring). These birds fly in flocks.

A description of bird-calls illustrates a method of reasoning by analogy. This results in a transference of human thoughts and emotions to animals, a process which gives animal fables their strong

appeal. For example, the pigeon says, *Tu kolela oku iwa* ("We believe in stealing"), and the following are further instances of the same kind.

*Ocinganja* is a bird which has several calls. Early in the year the female says as she looks at the newly hatched brood, "This year I have borne white children." Later the little birds grow black feathers. Then the mother cries, "Each year disappointment." Sometimes the female says to the cock bird, "A stick has stuck in my eye. I wonder whether it will make a growth there." The bird is probably the Black Flycatcher (*Melaenornis pammelaina*).

*Epandacokokoko* says, "Where will the guests stay? Where? Where? Where?" This is an unfailing intimation that strangers will visit the village.

*Omanula*. This is another bird which announces the approach of strangers by saying, "*Akombel! Akombel! Akombel!*" ("Guests! Guests! Guests!") Two birds are supposed to carry on a dialogue.

*Sankanjuele* says, "He who has eaten should leave the rest for the important ones," meaning himself.

*Ondonga* answers, "Do you mean me? The way you scold hurts me to my heart."

*Ungolombia*. The male and female birds *ungolombia* are about to cross a stream. The female says, "I am wearing four yards of cloth," meaning that she will get wet. The husband says, three times, "If you are wearing four yards of cloth, why do you not cross at the source of the river?"

*Ombovo* says, "When I lay my eggs on the ground, the white ants destroy them." The call continues, "When I lay them up high, *kalupamba* steals them." *Ombovo* cries, "Such hardship, goodness gracious me!" The exclamation is, "*A mai we*," literally, "O my mother!"

*Kacukuku* the Barn Owl (*Tyto alba*) and his mate speak together. The female says, "*Cimuku*, do you eat rats?" He answers, "I do not eat them, they have tails."

*Ungungu* says, "No big animal lays eggs, so the crocodile must be a bird, too."

*Ocimbamba* (night hawk) may be heard on moonlight nights saying, "O lion, here are the people."

*Ekuti* says, "My child is gone to *Koputu*." *Koputu*, in Umbundu, means a far off place. Possibly *Koputu* is a corruption of Oporto. This bird makes a monotonous and continuous cry from sunrise to sunset.

*Epumumu* (hornbills) are large black birds. The female says, "I'm going, I'm going, I'm going to our village." The male replies, "Don't go, don't go, the rain has come; let us plant."

*Katendipanga*. This bird is quiet until September, the month in which rain begins to fall. Then the bird says, "Save! Save! Save!" He means this as a warning to people who eat their corn instead of saving some for seed. The seed should be sown in October when the rains have begun. The derivation of the name of this bird is important. *Okulenda*, to count; *ovipanga*, the rows of corn in a field.

*Kalusundanjovo*. The female bird says, "Let's throw away the big drum." The male answers, "When we have thrown it away, what shall we do for dances?"

Observations of the weather are of importance in fixing dates for sowing and reaping; such dates are the base of time reckoning. Rainfall is important where cattle are kept, and a knowledge of the stars is of service to hunters and caravan leaders when following unfamiliar routes.

The weather is thought to be controlled to some extent by the *ocimbanda* ("medicine-man") and his performances. The rain-

maker's dance seen at Ngongo, a village of Ngalangi in east-central Angola, will be described in dealing with the *ocimbanda* (chapter IX).

No man thinks that the course of the sun can be altered, but there seems to be a hope that the setting of the sun may be delayed. A man who is likely to be overtaken by darkness breaks a piece from an ant hill. This fragment is placed in the forked branch of a tree while the suppliant says, "Sun, wait a little while for me."

Months are reckoned by observation of the moon. The new moon is *osai* ("moon") *yokaliye* ("new"). There is no word for half moon. The phrase for full moon is *osai ya tunga ohumba*. *Ohumba* means "basket"; therefore the idea appears to be that the full moon is round like the big basket used for field work.

A star is called *olumbungululu*. To describe a shooting star, the word *luenda* ("it goes") is added. The large bright morning star is *tanda*. Another bright star is *tielele*. Three bright stars in a line are the hunter, the dog, and the quarry. The three stars are *ukongo* ("hunter"), *lombua* ("the dog"), *locinyama* ("the animal").

An eclipse of the sun is *uteke vutanya*. The former word means "night," the latter word means "daylight." Hence the meaning is "night in daylight."

Small mammals are captured in cane traps or stunned with blunt wooden arrows. The pursuit of such animals is a pastime for boys who thereby receive their early training in hunting. Rats are used as food after being boiled and roasted. This fact accounts for interest in the following small mammals.

*Umbili*. This is a big black river rat, the largest of the water rats.

*Ocifelefele*. A big gray water rat (*Cricetomys*?), not so large as *umbili*.

*Kaleñe*. A river rat something like the preceding one in appearance. *Kaleñe* can stay in the water for a longer period than that endured by *ocifelefele*.

*Epeke*. This is a bush rat which is light gray in color.

*Ekolongonjo*. This rat stays in the bush. It builds a nest in an ant hill from which it comes out only at night. The color is gray.

*Elima* (*Epomophorus*). This is the name given to the fruit bat. The word *elima* means "not one thing and not another." Thus *elima* is the word applied to a mulatto; he is not a Negro, not a white man.

*Ozili* (*Rhabdomys*). This is a large light brown mouse having white stripes on his back.

*Ongenge*. A mouse.

*Epenque*. A black rat.

*Ocipili*. A mouse with a long thin nose, probably a shrew.

*Osiinge*. This is a very fat mouse.

*Nakalongaka*. This very small mouse makes a hole around which he piles grass to conceal the entrance.

*Onjomboloka* (*Lemniscomys*). A mouse with a stripe on his back.

*Kandoli* (*Dendromus*). A very little mouse something like *nakalongaka*.

Observation of reptiles is a necessary self-protection as there are many poisonous snakes. The flesh of the python is eaten. Snake-skin and lizard-skin are occasionally used; for example, in covering a round, hard fruit in order to make a ball for playing a game.

When collecting lizards and snakes I found that each kind had a well-known name, though there was occasional disagreement among the men consulted.

*Ocivangoko* is a lizard (*Agama planiceps*) about ten inches long whose tail is covered with sharp spines. This reptile has colors of bright blue, red, and orange. *Ovangu* is a large spinous gray lizard (*Agama atricoll*). *Ekangala* (*Gerrhosaurus nigrolineatus*) is a brilliantly colored lizard which burrows deeply into the ground.

*Ohutanjila* is a long slender green snake which hides in trees to capture birds. *Ombandanjila* is a long gray-backed snake with a light green belly. The generic name for snake is *onyoha*. The python is *omoma*. The chameleon (*eloñailo*) seems to be feared, as the men and boys refuse to touch a dead one but always move it with sticks. There is a proverb to the effect that the chameleon though slow always gets there. The refusal to touch even dead reptiles is due to an exaggerated fear of being bitten. I could find no other reason.

Trees are of importance in connection with building houses and wood-carving. The qualities of different timbers are well known to the Ovimbundu. For the main part, the collection of medicinal plants and their uses will be described in connection with the medicine-man. The following are the most common trees which are of economic importance.

*Usia* (pronounced *oosha*). This tree has an edible fruit the size of a walnut. The kernel is valued as a food.

*Ombula*. This tree provides wood which burns readily. The small skin-covered stools to be found in every hut are often made from this wood.

*Ukengo*. The fruit has a hard rind.

*Owindo*. This tree has a small acid fruit from which a medicine is made for the cure of painful menstruation.

*Usilosilo*. The leaf is compound and palmate. The fruit is black.

*Usiambiambia*. Bears a little red, oval fruit.

*Usole*. Has a large red fruit.

*Usombo*. Grows near streams. It has a fruit like that of *okulakula*, but smaller.

*Uhukungu*. Has a fruit like the berry of a coffee plant. The fruit is used for making mucilage which is used for capturing small birds.

*Omanda*. When this tree is small, the wood is springy, and is therefore useful for making bows. The wood of the older trees is burned for preparing charcoal which is used in the blacksmith's fire.

*Onundu*. This is an erect tree having no branches on the lower part. The wood is extensively used in building native huts.

- Omue*. A large tree having clusters of small white flowers which are visited by bees on account of their content of honey. The tree yields a hard wood from which charcoal is prepared. The bark and leaves yield a pigment which is used for dyeing cloth a yellowish brown.
- Osu*. Is valuable because it gives a hard wood used for the corner posts of houses. White ants do not attack this wood, which is therefore useful for making the uprights on which granaries are erected.
- Okapelangalo*. A tree from which planks of hard red wood are obtained. These are used for making doors in village fences.
- Osasa* or *ekenge* or *usamba*. These trees have small compound leaves which are very similar. The bark of the latter two is used as rope for binding the uprights and the crosspieces in the framework of native houses. *Ekenge* and *usamba* also yield a bark which is beaten into bark cloth in the Ngalangi district.
- Ociyeko*. The bark is used for binding posts, also for the fabrication of bark cloth.
- Ungolo*. The roots of this tree yield a dye for cloth. The leaves are said to have a value for curing sore eyes. The mother of a child afflicted with sore eyes chews the leaves, then spits into the child's eyes.
- Ongaye*. Yields a wood used for making pestles and pounding sticks.
- Omake* ("iron wood"). This tree has a hard wood which is used for the same purpose.
- Onjunge*. Gives a wood used in the making of houses, doors, and beehives.
- Omone*. A large tree which gives planks for building purposes.
- Uvanje*. Yields a useful red timber.
- Ulondangandu*. A tree with very rough bark. The word *ongandu* means a crocodile. This is the tree which even a crocodile can climb.
- Onganja*. A tree which yields a fruit having a value as a purgative. The antelope is said to be fond of the fruits of this tree.
- Ocikumbeolemba*. Gives a resinous fluid which is used in the preparation of lime for snaring birds.
- Ulemba*. This word is derived from the word *ulembo*, meaning shade. The *ombala* (native capital) of Ngalangi is surrounded by such trees.
- Omia*. A tree which produces yellow flowers in September. The fruit is not edible but oil is made from it.
- Ohuku*. A tree having fragrant flowers like those of honeysuckle. The thick bark is used in making mats.
- Osese*. A soft wood which is easily whittled with a knife. The figures from Bailundu (Plate XXI, Fig. 5) are often carved from this wood.
- Umbolombolo*. A soft wood which is not very strong.
- Umbangalunda*. A small tree which produces bright red fruits. These are used by women for the manufacture of bead necklaces.
- Ocilavi*. The wood is used for the heads of arrows for shooting birds. This timber is used in the building of pigpens. The branches have projections which are said to guard (*okulava*, to guard) the occupants of the pen.
- Itata*. From the roots of this tree a medicine for pulmonary complaints is made.
- Ukua*. This is the baobab, whose habitat is the dry regions. Some of the trees have enormous girth. They are leafless for a great part of the year. The long fruits make gourds. The seeds in the fruits are bitter.
- Ututuo* (pronounced *ootwātūwā*). From the wood the Ovimbundu make wooden platters and spoons used for serving mush from the large cooking pot.
- Onjiliti*. This tree yields a hard red wood which takes a lustrous polish. For this reason the wood is employed for making ornamental sticks and clubs.
- Upondanjamba*. This small tree has roots which girls use for making ankle-bands.

*Okalaluluka*. This tree has leaves which are used in treating a skin disease.  
*Uvendanguluwe*. This small tree, only three feet in height, gives straight twigs which are used in making arrow shafts.

## FOOD SUPPLY

### COLLECTING AND HUNTING

Collecting of natural products which serve as food substances is chiefly in the hands of women and children, though an exception has to be made in the instance of honey, which is gathered by men and boys.

Boys diligently search for nests, noting their location so as to be able to visit them again when the fledglings are large enough to serve as food. Large numbers of women and children may be seen gathering caterpillars in gourds. The insides of the caterpillars are squeezed into boiling water to make soup.

When a cloud of locusts appears, as in 1925, the creatures are gathered. They are sometimes fried, or they may be boiled in water, dried, and preserved with salt in earthenware pots.

A number of miscellaneous items of the food supply were mentioned in connection with names of trees whose fruits are gathered.

Boys engaged in food-gathering usually carry small bows and blunt wooden arrows (*ocilavi*). One type of bird arrow is fixed to the bowstring. The forward end of the arrow is split so that it may contain small stones that are ejected when the string is released. From the wild fig tree mucilage is obtained and this is boiled until it forms a thick paste which is smeared on the boughs of trees. Some of the small birds captured in this way are eaten, others are kept in wicker cages made by children.

In all parts of Angola large cylindrical beehives may be seen fixed high in the trees (Plate XC, Fig. 2). Two types of hive have been noted in particular. In the Elende district a hive is made by opposing two half cylinders of wood each about three feet long, so forming a hive which has a diameter of one foot. The ends are covered, with the exception of a small round hole. The whole structure is bound round with grass which is kept in position by lashings of bark. In the neighborhood of Cassanga a difference in the structure of the hives was noticed. This type of hive is made from a cylinder of strong reddish bark, the edges of which are fastened together with stout wooden pegs. The dimensions are the same as for the hive used in Elende, but the hive of bark is uncovered.

In the Elende district honey of wild bees is removed from the hives in the months of August and December. One man ascends

the tree in order to lower the hive with a long rope of bark or plaited fiber, while beneath the tree men are prepared to take the hive, which is opened over a smoky fire. The men wear no protection, consequently they are badly stung. Boys are encouraged to help, and those who run away receive no honey. Honey may be eaten alone or with manioc. No drink is made from honey only, but *ochasa* is the name given to beer with honey in it. *Ovingundu* is a drink made from pounded corn which has been soaked in water to which a little honey has been added. The drink is allowed to remain untouched over night; thus it becomes sweet and is mildly intoxicating.

Wax is a very important item of trade. In the remote places natives bring to small trading posts balls of wax which are about two pounds in weight. These in former days were a standard of exchange in terms of which other values could be measured. These balls of wax are made into large cakes for foreign export. In the Esole country a fiber strainer is used for cleaning the wax. Honey is sometimes dried in very large baskets which are three feet in diameter and two inches deep. These baskets were not observed among the Ovimbundu, but they are used in the region of Cassanga in southern Angola. The honey of wild bees when eaten in the comb is palatable; it would be more so if one could disregard the presence of numerous dead bees.

The bow is the chief weapon of the hunter. The release of the arrow is made with the index and middle fingers (Plate XXXIX, Fig. 1). I have observed this method among the Ovimbundu of the Benguela Highlands, in the region of Kipungo, in the far south among the Vakuanyama, and among the Vasele of the Novo Redondo hinterland. Arrows differ considerably in pattern as the illustrations show (Plate XVII, Figs. 1-9); the Ovimbundu have arrow-points of excellent workmanship. The manufacture of these arrow-points is one of the most skilled occupations of the blacksmith. Each man makes his own shafts and feathers them. The arrows of the Vasele have leaf-shaped iron points; so also have those used by the Vakuanyama.

Among the Ovimbundu are specialists who make bows from elastic woods called *usia* and *osambia*. The bow itself is *ohonji* and the arrow is *usongo*. At the third shot I saw a young Ovimbundu boy split a cane which was placed upright at a distance of thirty-three feet. The throwing club (*ohunya*) is used for killing small game such as hares.

The only spear (*unga*) that I have seen is made entirely of iron. The shaft is covered with the tail of an ox to which the tuft of hair remains attached. This is the spear formerly used in warfare. The distribution is wide. Such spears were purchased from the Ovimbundu of Elende and Bailundu and also from the Vakuanyama living in the far south of Angola, but I do not think that the Ovimbundu make these spears, which are probably traded from the south.

A hunter is considered exceptionally fortunate if he possesses an old muzzle-loading gun (*uta*). I have seen only two hunters who owned such a weapon. In one instance the barrel was bound to the stock with hide thongs, while the woodwork was decorated with brass tacks. Powder and fragments of metal are carried in a leather pouch which is attached to a broad, leather waist belt (Plate XIII, Fig. 6). There is certainly a feeling among hunters that the sale of a well-tryed weapon will be followed by bad luck. The gun is sometimes fixed to form a trap in such a way that an antelope may tread on the string and so discharge the gun. Sometimes a piece of meat is attached to a string which is fastened to the trigger. A heavy beam of wood into which an iron spike is fastened was used in districts where the hippopotamus and elephant were hunted. Such a trap was fixed over a path known to be frequented by these animals. Big game of this type is now rare.

In the Esole country the following traps are in use: (1) A deep, narrow, grass-covered pit from the bottom of which sharp stakes project upward; this trap is known as *okueve*. (2) A simple trap consisting of four long sharp stakes which are fixed in the ground so that they incline toward a gap through which a buck is likely to jump (Plate LXXIII, Fig. 2). (3) The trap (*ocisonga*) for lions and leopards. This is a heavily built structure provided with a panel-like door which slides down when the entering animal releases a cord fastened to the bait (Plate XCII, Fig. 2). (4) A heavy trap triangular in form. This trap is not an enclosure, but a covering under which the animal has to go in order to reach the bait. In addition to the foregoing examples there is a trap (*onjanjo*) which is used for snaring antelope. The essential of the device is a loop which is bound to the end of a supple branch lightly fastened to the ground. This, however, did not come under my observation.

Long, cone-shaped, cane structures are placed in the grass, which is then fired. Animals disturbed and frightened by the fire rush into the wide end of the trap, then make their way to the narrow end (Plate XV, Fig. 5). One such trap is modified to form a snare with

a noose which hangs over the entrance. From Ngalangi I obtained a trap formed by suspending a heavy block of wood inside a box. The animal enters a small circular hole, passes under the heavy block and begins to nibble the grain which is strewn on the bottom of the box. Presently he releases a fine string which brings down the block in such a way that he is pinned underneath. I am informed that this trap is used at Elende, but I have not seen it there.

Some hunters note the feeding and drinking places of their quarry, which is shot from a hiding place in a tree. Young animals may be run down by a hunter in open chase. Screens are not carried in front of a hunter, but he does sometimes dress in the skins of animals. His disguise is completed by wearing a tuft of the animal's hair on his head.

Dogs are used for tiring out young animals in the chase, and also for catching hares. There is a tendency at the present time to improve the breed of native dog by crossing with a large hunting dog from South Africa. In the Esole country I have seen, high on a granite rock, a small cairn of stones which covered the skull of a famous hunting dog. Dogs are used most commonly when the hunt is communal (Plate XXIII, Fig. 1), but the best hunters work alone without the aid of dogs. In the general hunt women and children may take part in driving the game; often a fire is started in the grass, which is very dry in the months of June and July. A hunter who works alone may excite the curiosity of an animal by blowing through a horn of an antelope. Spider's web covers the wide end of the horn.

I have observed a general hunt in which thirty men and boys participated, each carrying a bow and arrows. The party was accompanied by many dogs. The antelope which had been killed was carried on a pole slung on the shoulders of two men. There was intense excitement as the troop advanced toward their village, shouting and jumping. In another hunt of this kind muzzle-loading guns were carried. The Ovimbundu do not use nets in hunting, neither do they poison animals. Decoy animals are not used, but in the large wooden trap (*ocisonga*) a living goat or pig is placed.

It is necessary to distinguish between hunting as a general pastime, in which all males, and even women and children join to a certain extent, and the hunting of animals by a professional hunter. The professional hunter is usually called *ukongo* (less frequently *enyanga*); but there is no name for the non-professional hunter. A boy who wishes to become a professional hunter has to serve for a time with an *ukongo* before he himself receives this title. There is

an initiation feast when the training is ended. At the feast all people of the village may be present but they do not dance; only the professional hunters may do so. The boy who is to be initiated must not speak or move until he "feels the spirit on his head"; then he gives meat to the people. After hunters have captured game for the feast, the blood from these animals is used to smear over the bow, arrows, and spear which have been made for the novice by his tutor. This is analogous to the initiation of the young blacksmith who receives blood-sprinkled tools made by the master blacksmith.

There is in connection with the life and death of the professional hunter a certain amount of ritual and precaution. The night before setting out to hunt is a time of dancing and renewal of the implements of the chase, which are kept in a house specially prepared for them. A hunter who is on the eve of departure calls in other professional hunters to share the ceremony, which includes the rubbing of the bows and other implements with palm oil. A libation of beer is poured on the bows, spears, and arrows, but no medicine-man is present. Some of the bows are never used, because they are merely the symbols of the personality and prowess of dead hunters whose names they have taken. The food and cooking pots of a hunter must never be associated with those of ordinary household use. If a hunter is following the tracks of an animal he must not point with his finger as this action will drive the animal away. The correct way to point is by use of the feathered end of an arrow. The hunter must not sleep with his wife the night before setting out in quest of game.

I have frequently seen in front of the hut of a hunter a number of skulls of antelope and other animals mounted on poles arranged in circular formation (Plate XXXII, Fig. 2). These skulls seem to be trophies, which are invariably taken away by the hunter if he finds a new home. There is no reason to doubt the statement that these skulls are an offering to the spirits who give good luck in hunting, because such a belief would be in harmony with the general respect for ancestral ghosts, which are thought to influence the affairs of the living.

On several occasions, notably near Ganda and in the Cassonge country, I have seen the tombs of hunters. These are large structures built of slabs of granite laid with some symmetry. The rock tomb is invariably placed on the top of a commanding eminence of granite. The skulls of animals which the hunter has killed are piled on the top of the cairn, but I do not know whether these are the trophies

which are fixed on poles in front of the hunter's home during his lifetime (Plate XXXII, Figs. 1, 2).

There are at the funeral of a hunter special observances which will be mentioned under the heading of funeral rites.

#### FISHING

In the region of Elende there is fishing with both basket and line; a method of poisoning fish is also practised. Usually a male fishes with a bark line. Women catch fish by the poisoning method, and in addition to this they generally follow the procedure in which baskets are held or weighted in the stream. If the water flows swiftly men may take charge of the fishing operations. At times both men and women fish with nets. Husband and wife may not sleep together the night before fishing, as this is believed to make the male and female fish stay together at the bottom of the river.

The fishing line consists of tough green bark which is cut into strips whose length depends on the height of the river's bank. A hole is bored through the body of a grasshopper, a worm, or a grub taken from under the bark of a tree. Through this hole is passed a short stiff piece of grass about half an inch long, to which the line is attached. The fish is caught when the crosspiece of sharp grass becomes fast in its throat.

When the fisher throws the line he sings: "O fish, come and take your good thing. Do not send the little fish to spoil the good thing. Better you come and take the good thing with all your strength."

In order to make fish poison the tuberous roots of a plant are taken and soaked in water until a scum rises to the top. The solid part of the poison is not given, because it would sink and the fish which ate it would remain at the bottom of the river. Therefore only the scum of this poisonous infusion is thrown in the water. The stupefied, gasping fish remain at the surface, whereupon they are seized by women who transfer them to gourds or baskets worn around their necks. Usually poison is used only in the dry season when the rivers are shallow.

Sometimes there is fishing by means of a weir (*olunja*) which has an opening in the middle. On the lower side of this gap a basket trap is placed.

There is no fishing by torchlight. At the coast, and along the river Kwanza I have seen heavy dugout canoes in use; these were about twenty to thirty feet long and hollowed from single trees (Plate LXXII, Figs. 1, 2). At Ambrizette I noted the use of a fishing

spear eight feet long, the end of which consisted of ten sharp prongs of palm stem (Plate LXXIII, Fig. 1).

Near Cangamba in eastern Angola, fishing in the Kwando River occupied numerous men and women of the mixed tribes in the district, namely, Vachokue, Luchazi, and Babunda. Men paddled into midstream in small bark canoes from which fishing operations were directed. The fishermen carried small conical string nets, which were attached to stakes in such a way that the openings of the nets faced upstream. Vachokue women, working in pairs, dragged baskets against the current (Plate LXXXV, Figs. 1, 2).

#### AGRICULTURE AND COOKING

*Osila* is the Umbundu word for the granary which stands on wooden supports (Plate XLIV, Fig. 1); this *osila* is for the restricted family, and there is one *osila* for every house. The Ovimbundu store their corn in bulk, but in the Esole country I noted that the cobs themselves were carefully packed. Each Ovimbundu girl cultivates a small patch of ground, the produce of which she is at liberty to sell in order to buy brass ornaments, beads, and palm oil.

In addition to maize, barley, oats, and wheat, with here and there a little rye, are occasionally grown. There are three colors of beans, red, white, and black. There is no attempt to keep the varieties separate, so they cross-fertilize freely. The Ovimbundu try to cultivate a surplus of beans and maize which they use to pay their taxes to the Portuguese, likewise to sell at the stores of traders.

Corn is pounded on the rock which has been used for generations after it has been consecrated by sprinkling the blood of a chicken. Pounding begins as early as five o'clock in the morning, before sunrise, and from that time to sunset the pounding-rock is in use. The rock is evidently regarded as a meeting place for social intercourse; it is undoubtedly the center of village gossip so far as the women are concerned (Plate XXXVI, Fig. 2).

As corn alone is considered a poor food, it is sprinkled on boiling water to which beans are added. Cooking goes on from early morning to sunset over a slow fire. Children sometimes receive as their evening meal a thick plastic cake of mushed corn to which green leaves of a squash are added.

There are five kinds of manioc resembling one another in general appearance, but the Ovimbundu distinguish the plants, and reserve for each what they consider to be appropriate preparation. The method varies for sweet and bitter varieties of manioc.

*Olungunga* is not a sweet manioc, so is not eaten raw. The roots are placed to soak in a stream for three or four days before they are roasted on a fire, after which they may be eaten with impunity. As an alternative the roots may be dried in the sun; they are then pounded into meal which is scattered into boiling water so that a mush is formed. The Umbundu name for this preparation is *iputa viutombo*, meaning "mush of manioc." The leaves of *olungunga* are not soaked in water; on the contrary, they may be cooked as soon as they are gathered, but they must not be eaten when warm. There is no danger in eating them after they have been boiled and have been allowed to become cold. The leaves are served with salt or fat.

All the manioc, with the exception of *olungunga*, is sweet. *Kandona* has roots which may be eaten uncooked, but both leaves and roots are sometimes cooked in water. Other varieties of manioc known as *otetu*, *elemba*, and *esela* are eaten in the same way as *kandona*. Manioc is in use all the year, but the greatest quantity is consumed in November and December, a period when the growing corn is not ripe and the storage supplies have dwindled.

Sweet potatoes are plentiful all the year with the exception of the months of November and December. They are placed in the pot, without removal of the skin, and boiled for a period of twenty or thirty minutes. They are taken out, peeled, and eaten. European potatoes are sometimes peeled and made into a mush. The variety of garden produce naturally depends on proximity to a trading post, a mission, or some other European settlement.

In propagating manioc a stem is cut off from the parent plant which is about three feet high; but probably two or three years pass before the tubers are considered large enough for use. Sweet potatoes are planted in January, but there is very little of this food available in February and March. Toward the end of March or early in April a few potatoes may be ready for consumption.

Peanuts (*Arachis hypogaea*, Leguminosae) are planted in October by women who prepare patches of ground which are drilled with holes one inch deep and eight inches apart. One nut is placed in each hole after the shell has been removed. Above the ground small leaves appear. After the flower-stalk withers it has the peculiarity of elongating and bending down. In this way the young pod is forced underground, and the seeds mature a little way below the surface.

Some natives employ irrigation by leading small channels of water from a hillside stream to a garden containing maize and

bananas, but one could not say that irrigation is generally practised, even when circumstances permit.

The papaya and the banana are increasingly cultivated, but they are by no means generally distributed. Here and there I have seen a little sugar-cane cultivated by natives for their own use. Near the main railway natives may be seen selling their products, which include cabbages and tomatoes. Some natives are today planting the guava tree which yields sweet palatable fruits. The fruits *olosia* are collected from the *usia* tree. When ripe, the fruit is yellow, round, and about two inches in diameter. These fruits are gathered in September, and the kernels, which are about the size of walnuts, are eaten uncooked. No fruits are collected for storage. *Olombula* fruits ripen in October, when they are eaten raw.

Each wife sends the food which she has cooked in her own kitchen to the *onjango* ("council house"). After carrying the food to this house of assembly, where the men meet each evening, the women return to their houses to eat alone, or with the young children.

When there is a plurality of wives each has her own house and kitchen. Ngonga states that separate kitchens built outside the living houses are becoming more rare. The poor have their kitchens in the living room because they cannot provide separate structures for living and cooking.

The first meal is taken between five and six o'clock in the morning, the most usual food being meal sprinkled on boiling water to form a paste which is eaten with sweet potatoes. A mush of beans is eaten at night; generally there is no meal at midday. Three pounds of cooked beans are eaten by a person for one meal. Over the cooking pots leaves are placed to keep in the steam, especially when the pot contains sweet potatoes. I have made a meal from the sticky, gluey paste which results from sprinkling meal on boiling water. The chief objection to this food is the unpleasant quantity of grit in the meal, owing to the fact that it is pounded on the rocks. Manioc and sugar-cane are chewed at irregular intervals of the day.

The amount of meat consumed by the Ovimbundu is small in comparison with the quantity of vegetable food used. This adoption of diet of a particular kind is largely a matter of habit, and there is no good reason why meat should not form a larger proportion of the food supply. The Ovimbundu do not kill their cattle for food though they will eat the meat of oxen which have died from natural causes.

The flesh of goats, sheep, and pigs might be more frequently used if these animals were bred and cared for under some system of animal husbandry. The Ovimbundu are familiar with the preservation of meat by smoking and drying it, because flesh of animals killed in the chase is sometimes preserved in this way by hunters, yet the method is not widely and constantly applied in order to assure a regular supply of meat.

Failure to utilize the milk of cattle and goats is another example of the neglect of useful commodities. The Vacilenge, who are near neighbors of the Ovimbundu, milk their cows as do the Ovimbundu themselves in some districts, though the practice is by no means general. Even where cows are milked, butter and cheese are not made, though the Ovimbundu know of the process, which is practised by the Vakwanyama of southern Angola.

There are three kinds of beer. *Ocisangua* is a sweet beer which even children may drink because it is not intoxicating. Water is heated slowly in the pot but not boiled; meanwhile meal of Kafir corn or maize is added. Pounded sweet potato is strained in such a way that the liquid part goes into the beer pot; the residual mush is given to pigs. After the beer has cooled out of doors, it is transferred to a large gourd and allowed to stand over night. Next day it is considered a fit drink to consume or to offer to visitors (Plate XXIII, Fig. 3).

The making of an intoxicating beer *ekundi* proceeds as for *ocisangua*, but instead of adding strained liquid from sweet potatoes a root called *ombundi* is included in the brew. The large pot containing this beer is covered tightly and allowed to stand untouched for twenty-four hours, at the end of which time it is a potent drink. It is important to note that the corn is allowed to sprout in the ground before it is made into the infusion to which the root *ombundi* is added.

*Ocimbombo* is a strongly intoxicating drink. In order to prepare this brew, corn is soaked for a week; then it is left in the ground for the same length of time until it has germinated. It is then pounded on the rocks and placed in large pots filled with water to which sweet meal of corn is added. Simmering over the fire is continued for two days with constant stirring. This brew differs from *ekundi* in the longer germination of the corn and the longer period of simmering. On the fourth day after the simmering is completed the drink is said to be ready for consumption. If the people have honey, they add some to the brew on the third day of standing. My inform-

ant said, "Sometimes a man who has drunk this beer will sleep on the ground all day and say nothing."

Salt is a welcome gift in all parts of Angola. Native tribes appreciate its culinary value but show no eagerness to barter for the commodity. At the present time salt is sold in every trader's store, but in earlier times the substance had to be obtained along caravan routes from the coast and was therefore more highly prized than it is today. The Ovimbundu realize the value of salt in the diet of cattle; therefore the animals are occasionally driven to a salt lick in the hills. The Ovimbundu do not use this salt for their own diet, possibly because the salt enjoyed by the cattle is some form of potash and not sodium chloride.

The Vachokue extract salt from the leaves of a river plant by burning it to ashes which are soaked and strained. This is a common African method, but I did not hear of it among the Ovimbundu. The probability is that the Ovimbundu have always obtained salt from the coast.

In connection with cooking and brewing beer, methods of making fire are of importance.

Matches are coming into use among the Ovimbundu, but the necessity for them is not great as the hearth fire is not extinguished. In the center of each hut is a fireplace made of three hearth-stones over which logs of wood are placed with their ends in the fire which is kept alight by pushing the logs forward from time to time. A blaze is made by breaking off bark from the logs, placing it on the center of the fire and blowing. Fire is carried from one place to another by conveying a smoldering log. In the Esele country boys may be seen setting off at dawn to scare birds in the corn field, each carrying fire with him.

Usually the children or some other members of the family sleep on mats close to the fire, which requires no attention other than a pushing forward of the logs.

The Vasele make fire by the twirling method, and at Ngalangi the same procedure was witnessed. In the twirling method two different kinds of wood are used, soft wood for the base and hard wood for the twirling stick. The twirler used at Ngalangi was a piece of cane into the end of which a piece of hard white wood was secured by binding. Ngonga, my interpreter and informant, thinks that any man of the Ovimbundu could make fire by the twirling method if the necessity arose, but the performance witnessed at Ngalangi led me to doubt the truth of this statement. The operator

undoubtedly knew the apparatus and the method, but he appeared to have lost the dexterity which is necessary for a rapid moving of the hands from the bottom of the twirler to the top. There was consequently a long period of smoldering before the flame appeared.

Among the Vachokue a little wooden box of tinder, a piece of quartz, and an iron blade are carried for fire-making. From an Esele man a bag containing tinder and quartz was obtained.

The making of fire ceremonially in connection with ritual and sacrifice is described among the functions of the medicine-man, because the sacred and profane uses of fire are quite distinct.

Tobacco is a very important item of trade. The cultivation is a domestic industry followed usually by women but to some extent by men. In former days when the Ovimbundu traded extensively in Africa every man had a field of tobacco which he himself cultivated. At the present time each man is likely to have a mound of tobacco plants in the middle of a corn field (Plate XXIX, Fig. 1). Women do sometimes cultivate tobacco near their huts, but in this case the little plantation must be strongly fenced. Goats are numerous, and they eat the leaves of the tobacco plant with avidity.

Toward the end of September, when the rains begin, tobacco seed is sown on a patch of ground a yard square to raise seedlings which are planted out in October. A few flowers only are left to produce seed. As a further effort to improve the quality of the tobacco many of the lower leaves are removed. The cutting of leaves intended for use as tobacco is done by men in the months of February and March; women and children assist if the field is large.

After the midrib has been removed from each leaf, the leaves are suspended from the roof in a bundle. At the end of five days, when the leaves have turned brown, they are twisted into a long straight roll which is hung in the sun for three days. At intervals the roll is twisted in another direction. This gradually exposes all parts of the leaves, so that the drying is thorough. There are three methods of making up the rolls: *ombola* is an oval roll; *ongalo* is the round coil; *ocine* is the name given to tobacco which has been dried and twisted round a stick. Tobacco-pipes are varied in size and design (Plate XV, Figs. 1-3); those for men are larger than those used by women. A mixture of tobacco and hemp is smoked in a water-pipe made from the horn of a cow. Details of structure and ornament are given under "Wood-carving."

In order to make snuff a piece of dried tobacco is slowly baked near the fire on the end of a pointed stick which is turned frequently.

The snuff is pounded and placed in a small wooden box of cylindrical shape. Usually the box is ornamented with incised, burned patterns. The Ovimbundu of Bihé add ashes of wood to their snuff, so producing a mixture called *ulelemo*. The Ovimbundu of Elende usually use the snuff without adulteration. Two main species of tobacco plants are grown.

Women smoke in all parts of Angola. The Ovimbundu do not chew tobacco, neither have I seen it so used elsewhere in Angola. Boys and girls are not allowed to smoke before the age of thirteen years.

In the *ombala* of the Vangangella near Ngalangi, I asked a girl for her pipe which I desired for my collection. The interpreter took the pipe when she proffered it, explaining that, according to local custom, I had asked for the girl. If I took the proffered pipe *from her hand* I accepted her. Another social custom associated with tobacco is the passing of the communal pipe from hand to hand in the men's council house.

Ngonga, my interpreter, says that he has never seen an Ovimbundu woman smoke hemp, but he has seen a woman of the Vangangella (people to the east of the Ovimbundu) smoking hemp. Hemp (*epangue*) is cultivated only by the Ovimbundu men who smoke it. Pure hemp is smoked in the water-pipe which is not passed from hand to hand. Only tobacco is used in communal smoking. Smoking of hemp or tobacco consists of a few deep inhalations; there is not usually a prolonged placid smoking. When hemp is placed in the bowl of the water-pipe it is covered with large grains of sand or a piece of tin. This intervening substance prevents the hot coals from coming into contact with the hemp. The object is to secure slow ignition.

#### DOMESTIC ANIMALS

The principal domestic animals are cow (*onjindi*), ox (*ongombe*, which is also the generic name for cattle), bull (*onui*), sheep (*omeme*), goat (*ohombo*), pig (*ongulu*), dog (*ombua*), chicken (*osanji*) (Plates LV, LVI, LVII).

The transport animals, donkey, horse, and mule, are not used by the Ovimbundu of Elende and not to any extent by Ovimbundu of other parts; but in the south of Angola the Vakuanyama have sturdy ponies and well-kept mules. The ox when ridden by Portuguese is provided with a leather saddle which is very comfortable if covered with a blanket. The brass stirrups are broad and massive. Through the septum of the bullock's nostrils there is a short brass rod to the ends of which the reins are attached (Plate XXX, Fig. 1).

I have seen an Ocimbundu male riding an ox without saddle. A cord was passed through the animal's nose to serve as reins.

The Portuguese name for horse is *cavalo*, a word which the Ovimbundu use in the form *okavalu*, though there is an Umbundu word *ocingongovala*, which means "going with his neck up." The Umbundu words for donkey and mule are *ocimbulu* and *omula*, respectively.

Generally speaking, the ears of animals are not clipped, neither are cattle branded or otherwise marked to indicate ownership, but sometimes the ears of pigs and goats are cut to aid identification. When asked why the tips of the ears of dogs are mutilated an Ocimbundu will say that a dog with uncut ears does not hear when called (Plate LVI, Fig. 2).

Not many families own large herds of cattle among the Ovimbundu, and I did not see a big kraal until I was in southwest Angola. Cattle, which are a measure of wealth, are used for paying fines, making funeral feasts, paying debts, and securing wives. The cattle throughout Angola are well-developed, handsome animals (Plate LVII, Fig. 1). The bull remains with the herd the entire year; there is therefore no particular season for the birth of calves. Usually cows are not milked by the Ovimbundu, consequently these people have no milk, butter, or cheese. The Vakwanyama of the south milk their cows and churn butter in calabashes slung on a pole.

The Ovimbundu say that milking the cow makes the calf thin, but where the idea of milking the cow is borrowed from the Portuguese the Ovimbundu have a procedure which is as follows: The calf is allowed to suck for a few minutes in order to deceive the cow; then the milker begins his work. At intervals of a few minutes the calf is allowed to suck in order to continue the deception.

Cattle are killed at the funeral feasts of the rich, and the horns of the slaughtered animals are generally mounted on a pole in the vicinity of the grave (Plate XLVI, Fig. 2).

The horns of the cow may be used for making water-pipes in which tobacco is smoked, or they may be employed as magical horns when filled with medicine. The hide is pegged out in the sunlight for one day after it has been scraped; it is then rolled and kept until required. When about to be used, the skin is soaked in water for one day. The hide is used to cover the tops of stools, to make pouches and to manufacture bags for carrying corn. In bygone days each king had a wooden box covered with hide, which contained his powder and metal when he went to war. The cow's tail is used

as a sheath for covering the iron shafts of assagais, and it is sometimes made into a switch which the rain-maker uses during his performances.

Bulls are castrated when two years old. The wound is rubbed with ashes, salt, soot, and palm oil. Bullocks are used for riding, also for pull-carts introduced by the Boers. The herd obtains most of its food by grazing. In the dry season grass withers, with the result that the animals become thin and stall-feeding is necessary. In former days cattle-raiding was a practice of the Ovimbundu, who robbed the Vacilenge. It is certain that the Ovimbundu did not own cattle when they entered Angola. If the general tradition is correct the Ovimbundu came into Angola from a northeasterly direction, from the borders of the Belgian Congo as it is called today; this is not a cattle-raising region.

The Ovimbundu of Elende have a joke against the people of Bailundu, because the latter on first seeing a cow offered the animal some food on a wooden platter. This story suggests that the Bailundu people, who are of the Ovimbundu confederacy, did not know the animal and its habits as early as did the Ovimbundu themselves.

Although the Ovimbundu do not usually kill their cattle they may do so in the months of June and July, because at this time pasture is withered and food is scarce. Animals which are diseased, aged, or injured, are killed and eaten.

The native pig is distinguishable from European breeds by its long thin snout and slender development. This breed is said by the Director of Animal Husbandry, Humpata, to be the Keltic breed (Plate LV). There is, he says, no evidence to prove that the Ovimbundu have at any time domesticated pigs from the wild hogs which are to be found in Angola. There is no family which does not own a pig, and on the whole the pig fares much better than the sheep or the goat. The pig receives water and a daily ration of food, which is usually sweet potatoes and their leaves, together with some corn. Male pigs are castrated at any time between the ages of six months and one year by an operator who is a paid specialist. The fee for castrating a bull is four yards of cloth, but a small gift is considered sufficient reward for performing the operation on a pig. If a pig is thin, the leather is said to be of good quality and therefore suitable for making sheaths for knives. Usually the flesh of the pig is eaten shortly after the animal has been killed, but the meat of the bullock, on the contrary, is sometimes dried over a fire and preserved. But this is not a general practice as the animals are too valuable to be slaughtered.

Goats are more common than any other animal; there are few, if any, families which do not own one or more goats. These animals are not fed or watered. Goats are able to exist on almost any kind of vegetation; consequently these animals are, almost without exception, well nourished. Goats are not milked. Kids are born at any time of the year, and the young males are castrated. The hides are used for making bags. The goat has the misfortune to be the most desirable sacrificial animal. This is not entirely due to the fact that it is cheap and easily obtainable. The sheep is said to be unsuitable as a sacrifice, because it does not make a noise when killed. The hair of the goat is used for making an ornament named *osala*, which is worn by medicine-men.

Sheep are of the long-tailed Syrian breed. Like the goats, the sheep are not cared for in any way; they find their own pasture and water, and in doing so may wander for a considerable distance, though they always return to the village at sunset. The males are not castrated. Sheep are not so frequently kept as are goats and pigs. The skin is used for making bags. Twin births of calves, kids, or lambs are not regarded with awe; on the contrary, such births are welcome.

Almost every man keeps one or more dogs, and I have rarely seen a hut in which there were no dogs. Usually young puppies are near the fire, and on the whole dogs are well treated because they are valuable in hunting. They also give warning of the approach of hyenas, lions, and leopards. I have frequently seen a person run into the road to pick up a dog when an automobile is approaching. A tendency to improve the breed of dogs by crossing the lean native animal with a breed of large dogs from South Africa has been mentioned. In contrast with the generally considerate treatment of dogs by the Ovimbundu one has to note the very emaciated and diseased condition of dogs in the Esole country. Among the Ovimbundu dogs are regarded as desirable food.

Sacrifice of a dog at the inauguration of a blacksmith will presently be described. A medicine-man who is about to perform a ceremony for curing the sick has to make a meal of dog's flesh, but otherwise the flesh of the dog is taboo to him. These points of ceremony, taken in conjunction with the food value of the animal, and its use in hunting, show that the dog is highly esteemed.

Poultry are of very mixed breeds. The standards of size and weight are higher than is usual in African chickens, a fact which is perhaps attributable to contact of the Ovimbundu with the Portu-

guese for a long period. The chicken is highly esteemed as a sacrificial animal, but it could not be said that the flesh is in common use. This failure to develop and utilize to the full, again raises the point of social custom and economic habit. Chickens are cared for, as may be seen in the way they are cooped at night. Sometimes a hen may be seen sitting on her clutch of eggs in a dark corner of a hut, unmolested by people and dogs; yet it is certain that there is no concentration on the rearing of poultry.

Eggs are laid, and chickens are hatched throughout the year, except in the months of November and December when corn supplies are at their lowest ebb. Eggs are boiled, or fried on a fragment of pottery, but they are not sucked.

The domestic cat is not raised by the Ovimbundu. Wild cats are common, but there is no evidence of their domestication. Small birds and monkeys are sometimes kept as pets.

#### TRADE AND TRANSPORT

Caravan trade, which was at one time an important factor of tribal life, is now confined to short journeys for transporting corn, beans, and beeswax to traders' stores. But in spite of present-day decline of transportation the memory of more prosperous times still exists.

Names of distant places survive in the Umbundu language; thus Tanganyika is called Nakandundu, while the name for far eastern Angola is Muacimbundu, the name of a one-time important chief. The Umbundu language is understood in all parts of Angola, far away from typical Umbundu centers of culture.

In the old days there were professional leaders of caravans, and a ceremony was conducted before starting. The medicine-man and the village chief were the principal performers in a rite which consisted of bringing from its box the head of a former chief, sewn in oxhide. An animal was sacrificed so that the blood could be used for sprinkling on the chief's head, and on some occasions of this kind the head was sewn up in a new piece of oxhide. Direct appeal was made to the preserved head by the reigning chief, who asked for good fortune on the journey.

The medicine-man who accompanied a caravan carried with him a female wooden figure decorated with feathers (Plate XXI, Fig. 5). When a branching of the paths gave rise to doubts concerning the correct way the wooden figure was consulted by the medicine-man.

At the present time a day's march is twenty-five miles, during which a man carries sixty pounds, while the load for a woman is half that weight. The gait of the Ovimbundu includes a limp at every step, so suggesting that the carrier is lame or tired. This appears to be a method consciously adopted as a protection against fatigue, because all muscles are momentarily relaxed. Loads are carried on the head in a long forked stick to which they are lashed. When the carrier rests, the load is not placed on the ground, but is held upright on the stick (Plate XXX, Fig. 2). Such a method avoids the strain of lifting the load from the ground after each rest pause.

Although the Ovimbundu have an exchange of products among themselves by both barter and the use of Portuguese money, there are no large markets, with the exception of those at the coastal towns of Loanda, Lobito, and Benguela. There is absolutely nothing in Angola which can be compared with the great markets in Nigeria.

Despite the absence of a system of exchange on a large scale, the Ovimbundu have many terms describing units of measurement. There are native standards of length, area, and capacity, but no measures of weight which are undeniably of Umbundu origin.

The unit of length (*epaluma*) is the distance from the tip of the thumb to the tip of the middle finger when the hand is outstretched. The term for two of these units is *apaluma avali*. These words are the plural of *epaluma*; *avali* means two. These units are used to measure tobacco before it has been coiled.

Cloth is measured by stretching the arms to their full extent in line with the shoulders; the distance between the tips of the middle fingers is *epeka*. The stride for measuring land is *elianga*.

*Onjimba* is an area about twenty-five feet square. *Etemo* ("hoe") is an area of land two hundred yards long and thirty feet broad. A large field covers two or three *atemo*.

Measures of capacity are provided by various types of baskets. The large conical basket (*ohumba*) has an interwoven mark which indicates a measure for corn, meal, and beans. *Ocitenge* is a coarsely made basket used as a unit of capacity. *Uhamba* is a basket two feet long and one foot deep. The basket on a rectangular base is also *uhamba*, but at the present day cans are taking the place of all these old measures. Palm oil is measured in a gourd (*ocitau* or *ombangi*) of definite size. This little gourd is also used for measuring a viscous substance from trees. The word *ekokoto* is used to describe this mucilage.

Balls of wax and tobacco were, and are now, definite standards of trade. To some extent rubber as a medium of exchange has been used through contact with eastern Angola. The Umbundu word *ocilila* expresses a weight of about thirty kilos.

There is no measure for minutes or hours. I have seen a man of the Luchazi tribe keep account of the number of days taken on a journey by cutting notches on a stick. Ngonga says that the Ovimbundu reckon by cutting notches, also by knotting a piece of string. Three days would be expressed by the words *akumbi atatu* ("three suns"). The word day or sun is used in fixing a time. There is no word for week. A month is *osai*, which is the word for moon. When the corn is ripe the people say, "We are in a new year." Another yearly time mark is the arrival of the first rains, probably in the middle of September.

The words *oku lima* ("to cultivate") yield the word *ulima*, which designates the period between the beginnings of two rainy seasons. Corn is planted about the time of the first heavy rains, which occur in late September or early October. Naturally, this important occasion forms a somewhat uncertain time base; nevertheless it is the one used to express the lapse of years up to five in number. After such a period the estimation of time is unreliable.

## INDUSTRIES

### IRON-WORK

Among occupations of primary importance is that of the blacksmith (*ocivinda*). Owing to the increasing importation of hoe blades and other iron goods, together with the facilities for collecting scrap iron, the winning and smelting of iron is increasingly rare. There are probably very few places where the old type of conical clay furnace now exists. Almost any fragments of iron are melted at the forge where a box is kept to hold nails, hoop iron from packing cases, and other fragments resulting from proximity to a European culture.

Nothing is mixed with the iron, neither is there any casting in molds. The only process is the forging of red-hot iron. The Ovimbundu do not draw iron wire, although they know of the process which is practised by the Vachokue.

The work of the blacksmith was studied at the village of Njongolo in Elende. The men were for a time reticent respecting the nature of their training and the ceremony of initiation, but the chief of the village helped considerably by persuading the men to speak freely.

Any boy who wishes to become a blacksmith may be trained for the work. It is not necessary that his father should have been a blacksmith. When the youth begins his training he must be eighteen years of age and physically robust. His first duties are the beating of hot iron on the anvil; he is also required to collect and soften fragments of iron. He works very hard but is never allowed to finish anything; the master has to complete the work.

At the end of two years the youth asks the master blacksmith to examine him. What is more important still, the master is asked to make the heavy hammer (*onjundo*), which is used for beating hot iron on the largest anvil (Plate XXXVIII, Fig. 1). There is no doubt as to the sacredness of this hammer, which is a symbol of the completion of apprenticeship. There is also the idea of the master handing on his skill to the pupil by personally making and presenting the tools. I made repeated efforts before being able to purchase one of these hammers; finally it was procurable only at a high price. The value is due to ritualistic associations, the large quantity of iron used in the making, and the labor required to weld the head to the shaft.

On the day of his inception the boy has to purchase four chickens, two male and two female, one pup, and a goat. The master blacksmith makes all the tools for the apprentice, but ritual centers chiefly in the fabrication of the big hammer (*onjundo*). While the master is making this the boy stands on the small anvil which is close to the ground, between the forge and the large anvil under the tree.

When the hammer (*onjundo*) is made, and while it is still red-hot, the handle is pushed into the belly of the dog. The goat and the four chickens are then killed. All the tools are brought together so that blood from the slaughtered animals may be sprinkled over them. The flesh of these animals is eaten with corn and beans. "The blacksmith calls many people to help him, and they like to eat the food," concluded my interpreter.

During the entire ceremony, also throughout the feast, the boy stands on the anvil. There he remains until the master says, "You may speak and tell us what name you want." Perhaps the boy says, "I am Ndumbu." The people in the crowd clap hands and make a trilling with their fingers in their open mouths. The boy steps from the anvil; he is a blacksmith. My interpreter continued, "He must work hard and people must pay him. He used to work hard, but the master took the money."

There was an ancient belief that a blacksmith owed his skill to the help of the spirit of a person he had killed. Wooden effigies

of the murdered man were placed near the large anvil (p. 163), or they might be kept in the home of the blacksmith. Such figures are still used (Plate XXI, Fig. 3) but the killing of a victim is not now possible. Blacksmiths are free to marry without restrictions other than those imposed by the classificatory system of relationships.

The blacksmith's forge is a thatched house about twelve feet square with low eaves that almost reach the ground. The height from the floor to the point of the dome is fifteen feet. In the middle of the floor is a pit ten inches deep in which there is a quantity of charcoal brought from the charcoal burner's fire about half a mile away. At the sides of the pit are three stone seats for the workers. Two of these seats are occupied by men, each of whom works a pair of bellows. The two-chambered bellows is hewn from a block of wood in such a way as to give two circular air chambers from which wooden tubes lead to the fire. These wooden tubes are continued by clay tubes which project into the fire. Over the two round wooden chambers a piece of hide is stretched and tied over the woodwork. Two slender upright sticks, which the operator works up and down, are attached to the hide. In one corner of the hut there is a heap of charcoal, and in another corner lies the scrap iron. An iron rake with a wooden handle is used for stirring the charcoal in the fire. Plates XVI, XXXVII, and XXXVIII illustrate tools and processes.

The principal tools are:

(1) A flat stone anvil resting on rocks under a tree. The anvil is at such a height that the striker stands upright. At this anvil the metal is beaten with the heavy hammer *onjundo*.

(2) *Onjundo*, the most sacred of the tools, is 12.5 cm long. Its value is about that of an ox.

(3) There are tongs which can be clamped by a sliding metal ring. The larger tongs are 63 cm long and the smaller ones are 35 cm.

(4) The cutter is boat-shaped and triangular in cross section. The back, which is grasped in the hand, is 0.5 cm thick, tapering to a fine cutting edge.

(5) An iron holder for an axhead during the heating and hammering is 23 cm long. It is octagonal, hollow, and fits like a sheath over the shaft of the axhead.

(6) For heating the iron on the small anvil, after it has been roughly pounded to shape with the hammer (*onjundo*) on the large anvil, there is a smaller hammer (*usonjolo*) of which there are three varieties. These differ only in size.

The principal products of the forge are axheads, which can be reversed in the shaft so as to form adzes. Hoe blades, tools for mat-making, brass bracelets, knives, and implements for gouging out the pith of gourds or hollowing out a drum, are also made. Arrowheads are likewise an important manufacture.

The blacksmith makes a saw blade, 47 cm in length, from hoop iron. The teeth of the saw are turned alternately to the right and left and the serrated blade is roughly hafted in wood (Plate XVI, Fig. 4). Another product of the forge is an iron tool hafted in wood. The pointed blade, which is round in cross section, tapers to a point used for boring holes in wood, after the tool has been made red-hot. Small axes, many of which are used ceremonially in dances, have remarkably well-fashioned blades decorated with punched designs in the form of geometrical patterns.

#### WOOD-CARVING

A glance over the list of trees named and used by the Ovimbundu indicates a complete knowledge of woodcraft which is in the hands of specialists. To name only a few, there is the *omanda* tree, also the *omue*, which yield charcoal for the smithy. *Ombula* wood is used for stools, while the elastic timber from the *omanda* tree is suitable for bows. The *ekenge*, *usamba*, and *ociyeko* trees supply bark for binding crosspieces to the upright poles when making the framework of a house; the same bark is used by Ovimbundu and Vachokue of eastern Angola for making bark cloth. In addition to the use of bark for these purposes it is made into large cylindrical receptacles for maize, while its use for beehives is general throughout Angola. Beehives are often made by professional hunters. A traveler notices the mutilation of trees from which complete cylinders of bark have been removed (Plate XL, Fig. 2); half of the cylinder makes a receptacle for carrying on the shoulder.

When a small pig is to be transported, four holes are bored in the bark container. Through these holes the legs of the animal are placed and tied together on the under side (Plate XXXI, Fig. 1). This is a more humane transportation than that of tying the feet of the animal to a pole which is supported on the shoulders of the two men who are carriers.

In the neighborhood of Cangamba fishermen make and use canoes of bark about fifteen feet in length (Plate LXXXV, Fig. 2). This illustration shows a man taking his nets into midstream where they will be pegged to the river bed.

The tools used by the wood-carver are the saw, ax, adze, and knife. The products of this craft may be conveniently divided into the following groups:

- (1) Figurines of human form (Plate XXI, Figs. 1-6).
- (2) Animal forms, chiefly snakes, tortoises, birds, and lizards. The dog is sometimes represented (Plates XIX, Figs. 1-5; XLI, Fig. 1).
- (3) Parts of musical instruments, such as drums and the base-boards of *sansas*. The latter often have the metal keys mounted on boards decorated with elaborately incised patterns (Plates XLI, Fig. 2; XXII, Fig. 5).
- (4) Domestic implements and utensils, chief of which are heavy wooden beaters for flattening mud floors of houses, grain pounders, stools, cups, platters, bowls, and a heavy pestle and mortar (Plates XIII, Fig. 3; XVIII, Figs. 1, 2).
- (5) Carved sticks and clubs; these often show elaborate incised decorations of geometrical patterns. Frequently the head of the stick is carved to represent a human head or a full-length figure. The ornamented stick or club is carried as part of the personal dress and artistic equipment. The throwing club is usually a straight stick with an undecorated knob at the end (Plate XX, Figs. 1-10).
- (6) Carved wooden posts representing the human form. These are set up at the wayside. One has been obtained from a grave near Bailundu.
- (7) Tobacco-pipes and snuff boxes (Plate XV, Figs. 2, 4).

Figurines of human form require special consideration, because they have claims other than that of aesthetic expression. The figures representing Europeans, or natives using some article of foreign introduction, illustrate the grafting of foreign ideas on older methods of work.

The art of the African Negro has of late years been accorded a place of honor in critical circles of Europe and America (P. Guillaume and T. Munro, *Primitive Negro Sculpture*, New York, 1926). Usually, however, the formal technique of lines, curves, and the general aesthetic effect have been discussed to the exclusion of the ethnological background which determines style and function.

By far the best example of carved human figures collected in Angola was the one from Cangamba (Plate XXI, Fig. 4). This female figure, 60 cm high, is carved from hard, dark, red wood in such a way as to achieve a graceful result by the employment of a few

straight lines. The legs show the usual flexion of the knees and a shortening which is out of proportion to the body length. The lower limbs of most Angolan figures have these characteristics. The body of this figure is hollow and the head detachable. The incised head-dress is imitative of the coiffure of Vachokue women.

Cangamba, a village in eastern Angola, is a confluence of tribal elements, namely, Vambuella, Luchazi, Babunda, and Vachokue, whose physical appearance, hairdressing, tooth mutilation, and tribal marks differ considerably. The man who sold the figurine brought it furtively. He was an Ocimbundu, but the work is of Chokue origin. The figure, I am informed, was filled with medicine, then placed near a patient who was undergoing curative treatment.

The figurine (*ngeve*) of a woman having a number of dark feathers attached to her back has only one use. A caravan setting out for a long journey is accompanied by a medicine-man whose outfit includes such a figurine. Should the caravan leader be in doubt when choosing between two paths, the medicine-man sets up the image at the parting of the ways. He kneels before it and asks questions, then plugs his nostrils in order to make replies in a falsetto voice supposed to come from the figurine. Thus advised respecting the route to follow, the caravan continues its journey (Plate XXI, Fig. 5; p. 156).

The wooden figure (Plate XXI, Fig. 3) is of exceptional interest because of its connection with the blacksmith's craft, which is associated with introductory rites for apprentices. In former days a newly initiated blacksmith was expected to disappear for a period during which he killed a man. On returning to the work of his forge the blacksmith made a wooden figure of which this example, one of five obtained, is typical. The spirit of the murdered man took up its abode in the effigy and in this way helped with the work. The figure, which is of the usual dimensions, namely, 36 cm high, has the greater part of its surface covered with reddened earth (pp. 159-160).

Two figurines (Plate XXI, Figs. 1, 6) were obtained from women of the Vachokue tribe in the village of Ngongo, Ngalandi. Here the Vachokue and the Ovimbundu mingle to such an extent that customs are no doubt transferred from one culture to the other. These wooden images are used by childless women, or by women whose infants have died. The woman who sold these figures pressed them to her breasts to show the manner of use. People standing around smiled and nodded their approval. A wooden figure of this kind is substituted for a dead twin.

A common type of small figurine, some of which are female, others asexual, is represented by an illustration (Plate XXI, Fig. 2). Such little carvings are a normal part of the miscellaneous contents of a divination basket described in chapter IX. These figures have been obtained from Elende, Bailundu, and Caconda, all of which are centers of Umbundu culture.

In addition to the figurines described, the collection contains many more whose use may be conjectured. The interrogation of Ovimbundu people indicates clearly that there are specific uses of wooden figures which are consulted by the medicine-man. The foregoing explanations illustrate the nature of the beliefs associated with carved wooden figures, but it is not always possible to elicit a clear account of the specific use of each one.

Consideration of this aspect of the wood-carver's art has an important bearing on the culture contacts of the Ovimbundu. In studying this question I have instituted comparisons between these figures from the Ovimbundu of Angola and similar figures from the Kasai area of the Congo region (chapter X). The publications of the Musée Congo Belge provide illustrations for comparison with the figures in Field Museum's collection.

The carving of animal forms (Plate XIX, Figs. 1-5) is no more than a means of aesthetic expression resulting from accurate observations of animal life as recorded under "Nature Lore." Inquiry failed to show that figures of animals are, or were at any time, used in rites and ceremonies.

The carrying of a carved stick is essential when a chief is visiting, attending a council in his own village, or receiving visitors. The ornamental paddle (Plate XX, Fig. 8) was owned by the chief of the capital village (*ombala*) of the Vangangella, near Ngalangi.

At the death of a chief his staff of office, with his tobacco-pipe and sleeping mat, are placed in a small house where such relics of deceased chiefs are kept permanently (Plate XLVI, Fig. 1). Plate XX, Fig. 6, shows a staff of this kind which was preserved in a sacred house in the capital village of Ngalangi, and on the same plate are drawn short ornamental clubs which French ethnologists call *batons de promenade*, an appropriate name because of their use as part of the full dress equipment.

The Ovimbundu have specialized in the carving of small objects, for, in addition to clubs and staffs, tobacco-pipes and snuff boxes are often elaborately carved (Plate XV, Figs. 2, 4).

The water-pipe of the Ovimbundu consists of the horn of a cow into the side of which a short hollow pipe stem is introduced; at the top of the stem is a clay bowl for the reception of tobacco, or a mixture of tobacco and hemp. The wide end of the horn is plugged with clay, while a hole is made at the tip in order to provide a mouth-piece. A gourd water-pipe, similar to that used by the Vachokue, is also found among the Ovimbundu.

Cylindrical snuff boxes are ornamented with incised, burned, geometrical patterns. The lid is usually attached to the box by a leather thong. One large snuff box is ornamented with three well-carved female figures. The smoker's equipment is sometimes carried in a leather pouch fastened on a waist belt, or the container may be a hollow cylinder of ivory with a leather cap at each end.

To this information respecting the smoking and snuff-taking outfit of the Ovimbundu, some observations on the pipes and snuff boxes of other tribes should be added. When making a journey from Cangamba to Saurimo I seldom met an Ocivokue man who was not carrying a gourd water-pipe for the smoking of tobacco and hemp. Such pipes are usually ornamented with brass nails and are finely bound with thin brass wire (Plate XV, Fig. 3). One long pipe from Ngalangi has a pair of metal tongs attached for taking charcoal from the fire in order to ignite the tobacco (Plate XV, Fig. 1). A pipe with two bowls, closely resembling some Zulu patterns, was smoked by an Ocimbundu woman at Ngalangi. The Vachokue make snuff boxes from a yellow wood, which they ornament by burning portions of the surface in such a way that the yellow color is here and there visible.

Both men and women of the Vakipungo and Vakuanyama tribes carry snuff boxes of conical shape on their leather waist belts. At the top and bottom such snuff boxes are neatly bound with brass or copper wire.

#### DOMESTIC IMPLEMENTS

At an early age girls become accustomed to the use of the V-shaped pounder which is made from hard heavy wood (Plate XXXVI, Fig. 2). The small end of the shaft is a convenient thickness for grasping in such a way that the knuckles are on the under side of the shaft. This is the very reverse of what appears to be the natural grip. Women use the pounder with an easy, circular swing so that the flat round surface comes into contact with the grain on the rock. Endurance in this work is remarkable, and there is no doubt that

fatigue is avoided by the method of holding and swinging so that the work of crushing is done by the weight of the implement.

Two less usual methods of pulverizing grain are by use of a long pestle, which is worked up and down in a heavy wooden mortar as shown by Plate LXXXIV, Fig. 1, in which Vachokue women are so employed, and the crushing of grain with a cylindrical stone which is rolled on a flat slab. This latter method I judge to be very old, for on a pre-Umbundu site encircled by stone walls I have seen flat slabs of stone and cylindrical rollers. Some of the flat slabs were worn extremely thin in the middle and a few were perforated by the friction.

It is noteworthy that there are rocks especially reserved for the pounding of grain with the wooden mallet. Such rocks are to be found close to every village, and the dedication of a new rock for this purpose requires the killing of a chicken whose blood is sprinkled on the rock.

Work of this kind is begun before daybreak. From that time to sunset the pounding of the wooden mallets, accompanied by the singsong of the women, marks the progress of the day's work. At intervals the pounded grain is sifted through the hands and spread out on a basket-work tray, which is shaken to separate the fine meal. The unbroken and partly broken grain is replaced on the rock for further pounding. A small brush of grass is used for bringing together the grain which is dispersed by the blows.

The sole implement used in agriculture, which is entirely in the hands of women, is the hoe. Of this implement there are several variations according to locality. The Ovimbundu and others of Ngalangi employ the form illustrated in Plate XIII, Fig. 10. The long handles measuring 85 cm no doubt reduce fatigue by minimizing bending. Both hands are used, and, furthermore, the increased length of the handles must give a greater leverage. The smaller hoe used by Ovimbundu women of Elende has short handles only 51 cm (Plate XIII, Fig. 9), while that from the Esole country is distinguished by a broader blade and still shorter handles only 36 cm in length.

Included in the outfit of every Umbundu home is the heavy wooden floor beater. This implement, which is fashioned from a single piece of wood, consists of a narrow handle, round in cross section, and a flat portion for beating the moist, newly made, mud floor of the hut. The total length is about 83 cm.

Not only the carpenter, but almost every Ocimbundu man possesses an implement which may be readily adapted as ax or adze (Plate XIII, Fig. 2). The wooden shaft, from 50 to 70 cm in length, terminates in a narrow grip at one end, while the other end expands into a large oval knob into which a circular hole is bored. The strong iron blade, one of the main products of the local forge, can be removed. If the round tang of the blade is inserted so that the cutting edge is in the same plane as the shaft, the implement is an ax. On the contrary, insertion so that the cutting edge is at right angles to the shaft converts the implement into an adze. When placed over the shoulder this implement is used for carrying utensils in a fiber bag (Plate XXVIII, Fig. 1).

Gourds are of three main kinds, which may be found growing on the ground or resting on the roofs of houses at the ends of the climbing stems that bear them. *Ombenge* is a gourd which is narrow in the middle. It is often converted into a dipper for ladling liquids. The narrow neck is the handle, while a round hole is cut in the larger part so that the dipper can be filled with liquid. *Onganja* is round, or perhaps oval in form. There is a size used as a measure of capacity. *Onganja* can be used as a ladle by fixing it at the end of a stick. *Olukuembo* has a round body and a narrow hook-shaped neck; like the gourd *ombenge*, it is used as a ladle.

Gourds are elaborately decorated with incised and burned designs (Plate XII, Figs. 1-6). Usually these patterns are geometrical, but human figures and animals are sometimes included. Decorated gourds from Bailundu, used for containing beer at a wedding, are among the best examples of their kind (Plate XII, Fig. 6). The owner of a decorated gourd takes great pains to repair a crack with rattan, which is threaded through holes bored in the edges of the fracture. A large gourd is sometimes carried in a native-made net of vegetable fiber.

#### POTTERY

A large and varied collection of pottery has been acquired from the Ovimbundu, the Vachokue, and the Vasele. The shapes and styles are best indicated by the illustrations in Plate XIV, Figs. 1-5.

Among the Ovimbundu, only women make pots, which are inferior in workmanship to those of the Vachokue and the Vasele. At Elende, among the Ovimbundu, I was surprised to find a man making pottery. Further inquiry showed that he had learned his craft when young in the Vachokue country of eastern Angola. This man, whose work was not copied at all by Ovimbundu women, was regarded as a

specialist whose products were in great demand. Instead of making crude patterns with a piece of gourd, as do the Ovimbundu women, he presses a brass bracelet round the rims of the pots. The bracelet is deeply indented with geometrical patterns which appear on the clay (Plate XIV, Fig. 5). This man selects a very fine clay for his work, his products are symmetrical, and a polish is given with a smooth pebble after baking. Like all other potters of Angola, this artisan has no knowledge of the potter's wheel.

The vessels made by Vasele women, among whom the trade is confined to female specialists, are unlike the products from any other part of Angola. The chevron design is characteristic, so also is the ornamenting of the pot by laying on strips of clay below the rim. This is appliqué work which may consist of only a few bands of clay, or the strips may pass repeatedly round the pot until one-half or two-thirds of the surface has been covered (Plate XIV, Fig. 2).

At Elende two Ovimbundu women were observed during the pot-making processes (Plates XXXIII, XXXIV). Woman *A* built up the pot in a basket lined with wet leaves. Woman *B* pounded the clay on a stone with the heavy wooden pounder used for pounding corn on the rocks. Between the two women was a gourd of water in which *A* moistened her fingers. Operator *B* poured water on the clay which she was pounding. *A* made a cup of clay five inches in diameter and four inches deep which served as a base on which the pot was built up by the coiling process. This cup was placed in the basket containing moist leaves.

The rim of the cup was built in height and breadth by the addition of rolls of clay supplied by woman *B*. As the rolls of clay were laid on the edges of the pot, the inside was smoothed with a piece of gourd. Meanwhile the outside of the pot was supported with one hand. Shaping of the pot proceeded by applying smaller and smaller rolls of clay as the neck of the pot was approached. Gentle smoothing pressure forced out the greatest breadth of the pot just below the base of the neck. A pause was made to allow a partial drying before the neck was built up. Ornamentation consisted of making deep incisions with a piece of gourd while the pot was still wet. During these processes there was constant wetting of the hands.

The pots were sun dried, then fired several at a time by placing them in a kiln of dry grass. Polish was given to a pot while it was still hot by covering the surface with liquid made from a tuberous root, during which process the pot was quickly turned on a stick.

When the clay was being mixed an old pot was broken and pulverized so that some of the powder might be added to the new pot. There may be the underlying idea of continuity in the potter's art. The potters said, *Sanga yi pita* ("Lest it leak"). There may be no purpose other than the imparting of stability to the new clay.

I was unable to find any trace of ritual except with reference to the opening of a new clay pit. When a pit is first opened both men and women attend. The head of a chicken is twisted off by a medicine-man, then the bird is held over the pit by either a man or a woman. There is no law or ceremony to determine who shall take the first clay from the pit. The art of making pots is in the hands of female specialists so far as the Ovimbundu are concerned. Observation makes clear that women will go for a long distance to obtain clay from the pit which has been opened in a ceremonial manner. On their way to such a pit they pass clay which would serve their purpose well, but they do not use it. Children sometimes amuse themselves by making animals of clay.

The pottery of the Ovimbundu includes cooking vessels of many sizes, water containers, and very large pots for brewing beer (*olombia vi okukela*).

#### MATS AND BASKETS

This occupation illustrates division of labor on a sex basis. Baskets are made by women, while mat-making is an occupation for males. As with other trades there is specialization. The majority of women are able to make baskets though the skill of individuals varies. All women who have a knowledge of basketry understand the manufacture of dyes. Only a few men make mats; my informant thought that perhaps one man in ten would have the necessary skill. Such specialization is continued into other occupations; for example, only a few men spin cotton thread, while the majority of people buy pottery from expert female potters.

The mat-maker, generally an elderly male, uses two tools, a borer and a needle, both products of the native forge. The borer (*utomo*) for piercing the reeds, consists of a long thin blade in a wooden grip. The needle (*osinja*) is threaded with bark fiber and passed through the holes made by the *utomo*. The bark thread is *ombanja* (plural *olombanja*).

The sleeping mat (*esisa*) is made of reeds which are gathered in the early morning by a man who wets and binds his material into bundles, each of which contains reeds of the same length. The length of the reeds varies, of course, with the size of mat he intends to make.

The name *esisa* is given to the raw material as well as to the mat. The worker begins by laying out the reeds on the ground, side by side; then the slender tool *utomo* is passed through the reeds near their ends. This position is made permanent by sewing, and the process is repeated at intervals along the length of the reeds (Plate XLII, Figs. 1, 2).

*Evinda* is a large mat, about 120 cm long and 20 cm wide, while each strip of coarse elephant grass is about 3 cm wide. Ability to make the rush mat (*esisa*) is fairly common, but skill in making *evinda* is less usual. The mat *evinda* has several uses; it may be stretched on the floor or bed as a sleeping mat, or possibly it is rolled so that the ends can be fastened together; so treated it forms a cylinder which may be filled with grain when stood upright on the ground. A number of these mats is sometimes used to form a temporary storage place or shelter. The technique is of the twilled variety in which each weft passes over and under two warps.

*Ocala* is a coarse mat made from long stalks which are called "elephant grass" by the Boers; the agricultural term is "Napier's fodder." The long rods are white and glazed, so forming an artistic contrast to the crossbinding, which is of black bark. The technique is known as check, a term used to describe a structure in which warp and weft pass over and under each other singly.

The large mat (*ocikanga*) which is of soft texture shows neatly woven, diamond-shaped patterns of dark brown grass. The technique of this mat is of the twilled variety in which each weft passes over and then under two warps.

String bags, which are used for suspending gourds or hanging them over the shoulder, are made by men only. The root *ombundi*, mentioned in connection with brewing beer, is used for making string bags. Two fibers that have been teased out from the root are rolled tightly together by rubbing them between the palm and the thigh. Strong rope is sometimes made by plaiting coarse grass; this occupation is in the hands of males.

In basket-making the preparation of dyes is of great importance because colored strands of grass are inwoven to make named geometrical patterns (Plates IX; X). The Umbundu expression for dyeing is *oku lisa olosovo*.

Red coloring is produced by taking leaves of a plant named *evava* and cooking them in water along with the bark of the tree *ukondo*. *Ukondo* is the "tooth brush" tree because small pieces of its wood are chewed and used for cleaning the teeth. After the grass has

simmered in this infusion of *evava* leaves and *ukondo* bark, it is buried in a heap of ashes and earth. These processes produce the red coloring.

Yellow dye is made from the roots of a wild rhubarb (*ocilungulwila*) which has sagittate leaves. The roots are pounded and mixed with cold water, after which the grass is placed in the mixture. A pot containing the mixture is put on the fire and the contents are boiled for half an hour; at the end of this time the grass is an amber-yellow in color.

In order to dye grass black the leaves of *evava*, the plant used for making red dye, are mixed with an iron solution obtained from the mud of stagnant pools. If the grass which has been cooked in this mixture is not sufficiently dark it is reboiled in the *evava*-iron mixture to which the pounded leaves of *ungalo* are added. Brown coloring is made by mixing the red dye with the yellow.

Baskets made by the coiling process are the most common type manufactured by Ovimbundu women (Plate XV, Fig. 6). The large basket *ohumba* is a woman's field basket in which she carries corn, sweet potatoes, and manioc, along with her hoe and pounder (Plate XXVIII, Fig. 2). Each coil consists of a large number of strands of fine grass which are tightly bound. The coils of the better baskets are wrapped with the grass called *osoka*; this wrapping fastens each coil to the preceding coil. Coarser baskets have the coils wrapped with strips from the leaf of the screw pine (*emañalālo*). There is a sewing process in which the coils are bound to one another with the bark *olondovi*, which is kept damp during the process. I have seen a needle, threaded with bast, used for sewing coils together; the needle was rethreaded every time it passed through a coil. Success in basket-making depends largely on the ability of the worker to keep the coils of uniform thickness. There is constant inspection and plucking out of a strand of grass here and there (Plate XXXIX, Fig. 2).

In making basket trays (*ongalo*), the same coiling process is followed, but the work is kept flat. These trays are used for winnowing corn. Wicker-work is used for making conical traps for small game such as hares and rats. Conical fish traps are made of wicker-work. Names of patterns, which are of a simple geometrical kind, are well known to basket-makers. Sometimes a pattern is woven round the basket at a certain height to indicate a generally accepted standard for measurement of capacity.

Among the Ovimbundu are to be found baskets which they themselves seldom copy. These examples are from the Vachokue country of eastern Angola. The Vachokue specialize in making winnowing trays and rectangular baskets which are twilled by passing each weft over two or more warps.

By this technique, combined with the use of brown and black weft and warp, a great variety of geometrical patterns is produced. Trays of this kind vary in diameter from 50 to 200 cm. The Vachokue also make large strong trays in which honey is exposed to dry.

In the neighborhood of Cassanga wicker-work baskets are made. The warps or stakes are rigid while the more flexible wefts bend in and out. At this place there are both Ovimbundu and Vachokue inhabitants.

Women of the Vakuanyama in southern Angola make exceptionally neat little conical baskets by lashing coils very tightly. The lashing is done in such a way as to leave the outer surface covered with small chevron-shaped designs.

There is an intrusion of European influence which tends to mar the work of the Ovimbundu and other native craftswomen. Soft dyes produced by methods described are sometimes replaced by brightly colored, imported dyes; old ribbons from typewriters are soaked in order to extract coloring. The Ovimbundu are imitating European forms of basketry in a few centers, though the native method of coiling is still used.

#### WEAPONS

The bow of the Ovimbundu is made of hard red wood which takes a high polish after use. It is round in cross section and tapers considerably toward the ends. The length is usually 150 cm, not an inconvenient size in view of the fairly open bush through which the hunter has to make his way. The bowstring is made of a thin strip of twisted hide, which is looped over each end of the bow by a slip knot made of two half-hitches. A shoulder at each end of the bow shaft prevents the slip knot from passing down the shaft. In some examples only one end of the bow stave is notched. Usually, after completing the slip knot, the hunter leaves a surplus of bowstring which is wound round the shaft. One bow which is not notched has rattan wound round the stave to prevent the loops from slipping.

The bow for shooting bird arrows is small and is used only by boys; the string is of twisted vegetable fiber.

The foregoing description applies to all bows collected in Elende, an Umbundu center; neither is there any appreciable difference between these bows and those of the Vachokue of the area from Cangamba to Saurimo in Lunda. The bows collected in the Vachokue region are on the average 10 cm longer than those collected at Elende, a structural difference probably connected with the heavier arrowheads used by the Vachokue (Plate XVII, Figs. 1-9).

The Vakuanyama of southern Angola make and use a bow which bears very little resemblance to those already described. The arrows, too, are entirely different from those used by the Ovimbundu and Vachokue.

The lengths of three bows collected at Mongua, a typical Kuan-yama center, are 111, 123, and 123 cm. The bow stave, which is made from a monocotyledonous wood, is 5 cm broad in the widest part, while the cross section is a flattened ellipse. The bowstring is of twisted leather, looped at each end for slipping over the ends of the bow shaft (Plate XVII, Fig. 8).

According to L. S. B. Leakey (*A New Classification of the Bow and Arrow in Africa*, *J.R.A.I.*, LVI, 1926, pp. 259-294), the bows and arrows of Angola have not been studied. I am inclined to place the bows of the Ovimbundu and Vachokue with Leakey's "knotted string bows" (pp. 266-269).

Leakey states that the technique employed in stabilizing flight forms the best basis of classification of arrows, but so far as Angola is concerned, the shapes of arrowheads form a basis of classification according to locality. Ovimbundu, Vachokue, Vakuanyama, and Vasele, have distinctive patterns. Naturally there is borrowing of patterns where Ovimbundu and Vachokue intermingle, but, even so, there are distinguishing signs of Vachokue workmanship. The information respecting bows and arrows of Angola is best presented in paragraph form, and comparison of types is facilitated by reference to Plate XVII, Figs. 1-9.

The following arrows are used for killing birds:

(1) Elende. Ovimbundu boys use a wooden arrow with a heavy blunt head which is carved into five nodules (Plate XVII, Fig. 3). The head is tanged into a reed shaft and bound there with fine fiber covered with wax. The feathers are whole, bent over, and tied. The number of feathers varies considerably in different examples.

(2) Kipungo. The Vakupungo have a wooden-headed arrow with nine well-carved barbs (Plate XVII, Fig. 7). The head is socketed

fairly tightly into a reed shaft bound at the junction to prevent further splitting of the shaft. There are four whole, untrimmed feathers at the butt; these feathers are bent over and bound.

(3) Vakuanyama. Wooden arrows having eleven sets of barbs are in use. The head is bound into a reed shaft with strong gut. Another type of wooden arrow has three sets of barbs with three barbs in each set. There are four whole feathers at the butt.

(4) Vasele. The Vasele use an arrow, pointed with fine pieces of sharp bamboo, for shooting lizards (Plate XVII, Fig. 9).

The foregoing information (1-4) relates only to wooden arrows which are used by boys when hunting birds. The following paragraphs summarize the structural details of arrows used by men, and the data are arranged to call attention to differences in the patterns of arrows used by several principal tribes of Angola.

The Vasele make the arrow shafts of hollow reeds, and into these the narrow, ovate, iron heads are tanged and bound in position with fine bark which is not waxed. Three unsplit feathers are bent and tied to the shaft with fine bark fiber. The nock at the butt of the arrow is rectangular in shape and 0.3 cm deep. No quiver was observed.

The Ovimbundu form arrow shafts from hollow reeds, the average length of which is 76 cm. All arrowheads of iron are tanged and the tangs are inserted in the hollow reeds. A binding of fine bark fiber is given, and this is covered with wax. From five to ten feathers are used for each arrow. The feathers may be split or they may be left in the natural state. The trimming of the feathers is roughly executed. The depth of the rectangular nocks is 0.5 cm, and splitting of the shaft is prevented by binding the nock with fine bark. No quiver was observed.

The Vachokue of Cangamba, and thence northward to Saurimo, make arrow shafts of hollow reeds whose average length (79 cm) is a little in excess of those made by the Ovimbundu. The shapes of the iron heads are shown in comparison with those of the Ovimbundu (Plate XVII, Fig. 1). All arrowheads are tanged and bound into the hollow shaft with bark fiber which is then waxed. The feathers are split and bent with a neatness much greater than that shown in examples of Umbundu arrows. The rectangular nocks are 1 cm deep. No quiver was observed.

The Vakuanyama make solid wooden arrow shafts having an average length of 65 cm. The arrowheads of iron are socketed.

Three prevailing shapes of arrowhead are conical, narrow ovate, and V-shaped. The quills are split, bent over, and tied. The usual number of feathers used for each arrow is eight. The workmanship is neat and symmetrical. The rectangular nock is 0.5 cm deep. A quiver of hide is used.

In addition to the assagai (Plates XIII, Fig. 8; LXVIII, Fig. 2) commonly used by the Vakuanyama and adopted to a very limited extent by the Ovimbundu, there are spearheads which originate in eastern Angola among the Vachokue, whose blacksmiths are expert.

Typical spearheads were collected at Munyangi where Ovimbundu and Vachokue cultures meet. The leaf-shaped blade and tang have a length of 30 cm and an average breadth of 4 cm across the blade (Plate XVI, Fig. 1). The upper part of the tang, made for insertion into a wooden shaft, is round in cross section while the lower part is square. The blade, which has a keen edge, is well graded from a central, raised midrib to the margin.

I did not observe many spears among the Ovimbundu and Vachokue. The former value highly a type of assagai which is owned by every man of the Vakuanyama. At Elende and Bailundu I obtained from Ovimbundu men assagais identical with those collected in the Vakuanyama country. The assagai is made entirely of iron; it has a narrow, leaf-shaped iron blade which is socketed to the iron shaft. The butt is sharply pointed. The shaft passes through a cow's tail on which the tuft of hair remains. Consequently the iron shaft is encased in hide for part of its length.

At Elende I obtained from Ovimbundu men two spears said to be a product of the local forge. The flat, narrow, leaf-shaped blades were tanged into very rough wooden shafts. Wax was thickly smeared over the junction. The workmanship, which followed the tanged method of hafting arrowheads, was extremely crude.

By far the most distinctive knives made in Angola are those manufactured and used by the Vakuanyama of the extreme south (Plate XVI, Fig. 10). I have never found this knife in use elsewhere in Angola, and similar types are to be found only among the Ovambo to the south of the Vakuanyama.

These knives vary in length from 48 cm to 73 cm, with a breadth of 5 cm to 7 cm across the scabbard. The general outline is a well-balanced ellipse. The wood used is hard in texture and dark red in color. On one side the scabbard is left open in such a way as to display the blade, which is long, keen, and tapering. A leather thong attached to the back of the scabbard provides means of attach-

ment either to the arm or to the belt of the wearer. The crescent-shaped expansion at the tip of the scabbard is sometimes held between the toes while the blade is withdrawn.

A small knife obtained from an Ocivokue man near Saurimo in the province of Lunda, northeast Angola, has a black wooden haft neatly bound with fine brass wire (Plate XVI, Fig. 2). The steel blade of Vachokue workmanship is eminently suitable for the purpose for which it is employed, namely, that of carving pipe bowls and snuff boxes, which are sometimes elaborately incised. The knife has a distribution from Saurimo to Cangamba, an area of intermittent Vachokue culture, but I have never observed it in the possession of an Ocimbundu. Men of the Ovimbundu have knives of somewhat poor quality. The roughly made wooden haft is attached to a blade which is protected by a sheath of lizard skin. More frequently than not, an Ocimbundu does not carry a knife; neither does he appear to have borrowed knives or the art of making them from the expert Vakuananyama or Vachokue, who are reluctant to part with their tools and weapons.

A knife used by Vasele men in the region of Vila Nova de Selles, in the hinterland of Novo Redondo, resembles one used by the Bangala of the Congo (Plate XIII, Fig. 1). The distribution of the implement, which is used for cutting branches from trees, is local in the Esele country. I have never seen such a knife in use among the Ovimbundu or in any other part of Angola. The preservation of this peculiar form, in common with other specialized traits of Esele culture, is due to isolation of the Vasele among hills difficult of access.

#### LEATHER WORK

Leather pouches worn on a broad leather belt are part of the essential equipment of a hunter. The pouch usually contains scrap metal and powder for muzzle-loading guns. This type of firearm is, under present Portuguese regulations, difficult to obtain and still more difficult to furnish with powder, which is forbidden to the native. Consequently such a pouch may contain only a pipe and tobacco.

The pouch itself is either square, rectangular, or semi-cylindrical in shape (Plate XIII, Fig. 6). The hair may or may not have been removed from the hide. Some examples show signs of careful workmanship in stamping cross-shaped patterns. Brass-headed nails are used for decorative effect on these pouches among the Ovimbundu of Elende and as far south as Huila.

In addition to pouches, hide is used by the Ovimbundu for the seats of four-legged wooden stools. Before stretching the hide over the wooden frame the edge of the leather is cut into strips which are interlaced on the under side of the stool (Plate XVIII, Fig. 1). There are few evidences of the hide having been dressed; usually the hair is attached. The Ovimbundu understand the dressing of hides in a crude way. The hide is soaked, after which the inner surface is rubbed with ashes. The hair is scraped away and the hide is tightly pegged out. Hide was formerly used for covering wooden boxes in which a king carried his powder and possessions to war. Scraped hide is used to form the tympanum in tubular wooden drums.

In only one part of Angola, notably in the south among the Vakwanyama, is leather used as clothing. Women wear pleated skirts of hide and several broad leather belts, while the men have small leather aprons in front and behind. Men only are the leather workers. The hide is soaked and trampled under foot for many hours in order to soften it and make it pliable; the hair is not removed. Before leather clothing is worn it is thickly greased with a mixture of fat and red powder from *tukula* wood (Plates LXV, Figs. 1-3; LXVII, Fig. 1).

#### SPINNING AND WEAVING

My interpreter Ngonga remembers the use of a heavy upright loom about twenty years ago, but this loom is not used at the present time among the Ovimbundu. The Ovimbundu have been in contact with Europeans for three centuries. This has not been a close and permanent contact, but it has been sufficient to account for the disappearance of a one-time essential art. There are in Elende some very fine raffia palm trees, but no use is made of the leaf fiber for manufacturing clothes. Bark cloth is not made by the Ovimbundu of Elende, but I have seen the Vangangella and Ovimbundu of Ngalandi engaged in stripping, beating, and preparing bark for use as clothing, which is formed of one piece wound round the body. The bark cloth is not dyed or decorated with patterns.

Frequently at Elende men are seen engaged in spinning cotton which is used for repairs, and not for fabricating garments. The cotton is obtained from a shrub which has reddish leaves and yellow flowers. The cotton may be seen protruding from the calyx in the months of June and July. The man who is winding holds high in his left hand a slender stick which is wrapped for a length of two feet with fluffy cotton. All work of pressing and twisting the cotton into a thread is done by the thumb and index finger of the right hand.

In the beginning a thread from the fluffy mass on the stick is fastened to a corn cob or to a potato, the weight of which keeps the thread taut (Plate XXXVI, Fig. 1).

I have never seen a woman spinning and am informed that in former days the working of the loom was a task for men only.

In presenting facts bearing on the economic life of the Ovimbundu attention has been paid to the importance of ritual, specialization in industry, and division of labor on a sex basis. Clearly, the economic life is one of the fundamentals of social structure, while at many points it is a field in which the magician works.

Topography and climate have fixed certain conditions which, so far as the Benguela Highlands are concerned, favor agriculture on an extensive scale, also the keeping of cattle. In the Benguela Highlands a moderate temperature, combined with sufficient rainfall, has produced a type of vegetation which provides timbers serviceable to the craftsman, together with bush that affords shelter for game.

The bearing of these economic facts on the probable origins of traits, and their assembly to form the tribal life of the Ovimbundu, is reserved for discussion in chapters dealing with culture contacts and cultural processes. In chapters X-XII the factual material presented here under "Economic Life" is correlated with what is known of similar activities in cultures surrounding that of the Ovimbundu.

## VI. SOCIAL LIFE

### SEXUAL RELATIONS

#### COURTSHIP

There is a certain humor and quaintness of language used by Ngonga in describing sexual relations of the Ovimbundu. So far as possible the interpreter's style of expression has been preserved because of its value in revealing the native attitude.

When a man begins to like a girl, he looks at her for several days. Perhaps the boy will talk to the girl who will tell him to go to her father and mother. The boy must ask the parents for a friendship, which may last for one or two years. During this time the boy must not do anything to the girl, and if he tries she ought to tell her parents. If a baby were born to them in this time it would be a shameful thing. After the boy has told the parents that he wishes to marry the girl he must find something to give to them. The girl must have agreed to marriage before the boy asks the parents. The first token may be no more than a ball of wax or a present of salt. This token says, "The girl is mine," and no other boy will ask for her because it is understood that she is promised to somebody. In former days there were restrictions against marriage with other tribes, but in eastern Angola at the present day the Ovimbundu occasionally marry with the Vachokue.

Soon the boy will start building a house on his father's plot, because he intends to bring the girl to his father's land. The boy must at this stage make a further present to the parents of the girl. In the old days he would take about five kilos of salt; but now he will take a bottle of Portuguese wine, two or three blankets, or a piece of cloth. The people who carry the present must be the brother, father, or a male cousin of the suitor. These relatives will say, "This is the day we have come for our boy's wife." Then the parents will examine the things. Perhaps they will say, "You must bring a better blanket." The father or the girl's mother's brother must call the relatives of the girl to a council (*onjango*) where the relatives of the boy and girl are gathered.

The parents say, "We are taking these things for our daughter; we hope she will be a good girl and not shame us. She is a good girl to us and we hope she will be a good girl in your house." The girl's parents turn to her and say, "We should like to hear that you are hospitable; give food to your husband's relatives when they visit

you." There is no infant betrothal. There is not and never was any compulsion of a girl in marriage, but slave girls were disposed of in marriage by their masters.

A girl is not allowed to do anything to show that she loves a boy, for it would be a great shame for her to tell the boy that she loves him. Often a girl who prefers a boy will pretend that she does not like him. The Ovimbundu have a story which states that a man said, "I will bring my cow to the green grass"; he did so, but the cow would not eat. This expresses the idea that a boy would not like a girl who confessed a preference for him.

### MARRIAGE

The prospective bride chooses one married woman and six unmarried girls to accompany her to the house prepared by her husband. Here a feast consisting of a pig and some chickens is provided by the husband for the relatives of both families. For three nights the girl returns to the house of her parents while the boy sleeps at his home. The married woman and six girls sleep at the house prepared by the bridegroom. During these days beer is provided by the boy's parents. The prospective husband is ironically addressed as *sandombua*. *Ndombua* means bridegroom, *sa* is an abbreviation of *isia* meaning father. The term "father bridegroom" refers to the fact that the youth is a potential husband only; the marriage has not been consummated.

On the fourth day the bride brings her supply of domestic utensils. These are the cooking pots (*olombia*); the wooden spoons (*ovito*); the brush of grass for sweeping (*olueyo*); some meal; also the pounder (*upi*). For the first month the wife is not allowed to cook in her own home; she cooks food in the home of her husband's parents and sends it to the council house (*onjango*) where her husband takes his meals with other men according to Umbundu custom. At the end of the first month of married life the mother of the husband invites any three old women who have been happily married to lay the hearth stones in the new home. Each of the old women brings a stone for the hearth. A chicken is killed and its blood is sprinkled on the hearth stones. While the young wife is preparing food at the new hearth, she is helped by the old women. If the girl is stirring with the big wooden spoon, one of the old women places her own hands over those of the girl. There is this kind of guidance in every action.

I understand that at the present day virginity in a bride is not so highly valued as in former days. The old custom was an examination

of the girl by her husband, and if she were not a virgin he took a hot stick from the fire and burned a hole through her loin cloth. "The girl began to cry, but she had to take the burned cloth to her mother." In such an instance there does not seem to be an idea of guilt. The husband had accepted something that was damaged, and the payment of a pig by the girl's parents reunited the two young people. In former days, also at present, there are boy and girl companions who sleep together, supposedly without having sexual connections, although they may be seventeen years of age. The girl calls the boy *ombaisi*, and he calls her by the same name. The Ovimbundu understand something of the physiology of conception; the woman is, however, regarded as only a receiving vessel. "The man puts something into her which grows."

Husband and wife do not sleep in the same bed during the wife's menstrual period; the wife sleeps on a mat at the side of her husband's bed. A woman who is menstruating never cooks food, but women give mutual aid in this matter. A man with more than one wife sleeps either four nights or seven nights with each; the four-night cycle is more usual than the seven-night cycle among the Ovimbundu. Each wife has a separate hut and kitchen. There is no wife lending, but a visitor may be provided with a widow or even with an unmarried girl. Then the man would have to pay the woman.

Ngonga was able to give information with regard to homosexuality. "There are men who want men, and women who want women." Ngonga says he has heard people talk about it, and "they think this very bad." A woman has been known to make an artificial penis for use with another woman. The medicine-man will sometimes dress as a woman. Ngonga, who has seen a man dress as a woman, stated that the man arranged his cloth like that of a woman, put palm oil on his hair, and joined the women to pound corn on the rocks. "The other people laughed and spoke bad words to him. His brother, father, and uncle beat him," but without producing reformation.

#### DIVORCE

There are many grounds on which a man may secure a divorce, but it does not follow that divorce is frequent. On the contrary the evidence indicates that the majority of difficulties are overcome by a compromise between the relations of the husband and those of the wife. The main causes of dissatisfaction with a wife are want of ability in cultivating her garden, physical weakness, a habit of thieving from the gardens of other women, incompetence in cooking,

bad temper, too much talking, some physical defect arising from childbirth, and infidelity. But the husband usually accepts payment from the adulterer, and in that event divorce is not sought.

If a mother has no milk, there is a likelihood that her children will die in infancy; this is a cause for divorce. Barrenness gives great dissatisfaction, but is not necessarily a cause for divorce. Usually the husband marries another girl, while the first wife retains her position as head-wife. With regard to frigidity my informant said that sometimes "a married woman does not want her husband to do those things which husbands like to do, or she may want him very seldom." The husband is so angry that he may go away hunting for a long time. The husband may tell some old people, who talk to the girl. If his wife is a good cook, the husband may keep her and secure another girl as a second wife. Sometimes the husband ties the hands of the girl if she resists him. If a wife is returned to her parents on the grounds of her frigidity her husband does not receive compensatory payment, but he hopes that another man will take the girl and pay him for her.

Sterility of the male is sometimes suspected, in which case the husband tries another girl, possibly with his wife's consent. The wife may be allowed to have relations with another man in the hope of producing children. The evidence shows that there is definite experiment to test barrenness of the woman and sterility of the male.

In case of impotence (not sterility of the male sperm) the wife leaves her husband. In event of barrenness the woman visits a medicine-man, who gives her a charm consisting of two cowrie shells on a strip of leather which she wears round her neck; a potion also will be given her. If the barren condition is due to malevolence of spirits, the face of the woman is painted with streaks of red and white. Such a woman is said to gain *ocitumba*. *Tumba* means "a swell," "a rise."

A woman may divorce her husband if he does not treat her well. If he beats her or refuses to give her cloth and palm oil, she will leave him; but she will not leave him if he is merely unfaithful. If a woman is unhappy with her husband, she will tell her people about the trouble. Her father and mother may say, "Go and try again."

After a year the woman may still be unhappy, in which case she goes to her parents. The husband visits his wife's parents to ask why she has left him. The parents give reasons and offer to return the token he presented for the girl. The return of the husband's tokens is usually long delayed because the parents of the girl are

hoping that another man will ask for their daughter; this new suitor will have to make payment to the deserted husband. The chief of the village is not consulted unless the return of the husband's presents is long delayed or is in some way unsatisfactory. A woman who claims even remote relationship with the royal family is treated well, because her husband is afraid of the influence which may be used against him. A woman who returns to her parents takes with her the articles she contributed to the home; these are pottery, corn baskets, a wooden pounder, and wooden spoons. If a wife returns to her parents without telling her husband that she intends going, he will beat her if he finds her packing up her utensils.

The procedure of divorce contains a very human element. When a man has fully decided that he would like to divorce his wife, he will first of all inform his parents of his intention. The parents may advise their son to try the girl for a longer time.

On the contrary, the parents of the man may be mischief-makers. Sometimes the parents will say to the husband, "Do you know that your wife is doing these things? It is better you should send her away." If the man is fond of his wife, he will take her to another place where his parents cannot watch her. When a woman divorces her husband to marry another man, she takes to her new home all children under three years of age. Older children go to the home of her parents.

The chief of the village has to witness the final ceremony of divorcing a woman; but the husband and wife, also the wife's father, are the principal people concerned in the divorce ceremony. The husband receives from his wife's father a roll of tobacco and a pig, then he places leaves and palm oil on the back of his wife. He slaps her back saying, "It is finished," after which the woman goes to her father or to another man.

When a woman takes the initiative and has declared her intention of divorcing her husband, she returns to her parents as described; but the divorce cannot be completed until the husband has been persuaded to perform this ceremony of slapping her back and making a ceremonial renunciation in public.

#### PREGNANCY AND CHILDBIRTH

When a woman finds that she is pregnant, she makes and drinks an infusion prepared from bark fiber. This is to insure the removal of all stringy matter at delivery. Formerly a husband was not

supposed to have intercourse with his wife during her pregnancy, but this custom of continence is declining.

A pregnant woman in particular must not steal. If she does so, her child will refuse to be born until some one present at the confinement goes out and steals something.

Eating the flesh of a hare during pregnancy will give the baby a split lip. If the flesh of the owl is eaten, the baby will have large round eyes.

The expectant mother must not sit on a mortar, a pestle, or a piece of rock; if she does so, labor will be prolonged.

A pregnant woman takes earth from just outside her door. She drinks this in water so that the placenta will be delivered whole.

A pregnant woman is not supposed to carry anything in her cloth. If she does so, the child will have a long head.

A pregnant woman is a potential corpse. A man ought not to quarrel with his pregnant wife and if she says angry things to him he should not reply. He would not speak to a corpse in anger; on the contrary, he would respect a corpse; he must, therefore, respect a pregnant woman. It is a bad omen to see a pregnant woman up in a tree. A man who sees such a woman is expected to shoot her.

If a pregnant woman has scolded her husband and is sorry, she goes out to the fields. There she gets her cloth covered with burrs then returns home. If her husband begins to pick off the burrs there is reconciliation.

There are several arrangements whereby a woman who has borne only girls may secure male births, provided she can find a woman who has borne only boys and is anxious to have a girl. The simplest way of reversing the births is for the women to exchange belts. The belt is a string, or possibly a plaited fiber girdle an inch in width which is worn next to the body. From this string depends the woman's lower garment. A second way of reversing the births is for the women to make an exchange of food through a hole in the wall of a hut. The food is handed in on a basket tray. The woman inside the hut receives the food while standing with her back to the hole; she then places the food under the bed. The tray is handed back through the hole by the recipient who still keeps her back to the aperture. There is a third method whereby a woman who has borne boys may be made to bear girls, and *vice versa*. The woman who has borne only boys gives to the woman who has borne only girls, an arrow, a knife, a bow, and an ax. The articles given in return are a pounding stick, a broom, a tray and a basket. The value

of this symbolism relating to occupations of males and females respectively, is obvious.

Many women bear children when they are away in the fields, but help at home is often given. The mothers of the wife and of the husband may not be present at the confinement. No childless woman may be near during the confinement or convalescence. The father may not be present or "the child would be ashamed to be born." Before and during her pregnancy a woman feeds her husband with a prickly plant which is mixed in his food; this makes him faithful to her.

The abdomen is bound after delivery in order to keep the uterus in position. There is a very small amount of bleeding after childbirth; in fact the flow of blood is quite finished in two or three days. The nearer the diet comes to that of the white man the greater the bleeding at delivery. A pregnant woman may not beat a drum, or she will bear a drum. A woman who sees the blood from circumcision of a male will not have any children.

When a female child is born, the umbilical cord is cut with a hoe to ensure that the female will be a good worker in the field. The cord of a male is cut with an arrow to insure good hunting. A newly born child receives a drink of beer, and a cord is tied round its waist. This is not for support; it is the string from which, much later, the lower garment hangs. Girls do not menstruate until they are fifteen or even seventeen years of age. During the months after first menstruation a girl advances rapidly from childhood to womanhood.

The medicines that women take to secure abortions are bitter. A woman will refuse quinine because she thinks it will cause abortion. It is certain that twins are welcome among the Ovimbundu, but there are special observances connected with their birth and death. A twin birth is not thought to imply dual fatherhood. Twins are called Njamba ("elephant") and Hosi ("lion"). Although twins are of opposite sexes each receives one of the two names. Njamba is the first born, and Hosi is the second to be delivered. The medicine-man holds a ceremony to cure the mother of twins. The afterbirth of twins is placed in two gourds and carried outside the village for burial by two midwives. The mother of twins must wear round her neck the horn of an antelope given by the medicine-man. She has to blow this when crossing a river, meeting a crowd of people, or seeing a hawk overhead. People laugh at her and in fun say that she is a pig or a bitch. "The woman says the same kind of words to them." Children may be adopted, but they never really

belong to the foster parents. When an adopted girl marries, half the presents from the husband are given to the natural parents, and the other half to the foster parents.

In a case of triple birth at Ngalangi two infants died at birth; the other succumbed after three months. In another instance a woman bore three children and in the vernacular of my informant "something which was nothing," but all died. In a third case of triple birth a woman had a boy and two girls. The boy died at the age of fifteen years; the girls grew up and bore children. Albinos do not find it easy to obtain wives. I was told that an albino man at Ngalangi could not find a wife until he married a widow who had several children, because unmarried girls of his own age did not want him. One of the charms collected has to be worn by a woman who has triplets. The object is a rattle (*olusangu*), which the woman shakes when she meets any one. If she gave an ordinary greeting the children would die.

The greater part of this information was obtained at Ngalangi by interrogating women who were questioned in Umbundu by Mrs. McDowell. At Elende I asked my interpreter Ngonga to interrogate his wife. According to Ngonga a woman must visit a female practitioner in the first month of her pregnancy. The face and the body of the pregnant woman are painted with red, black, and white spots. This means that she will have no difficulty in bearing children, neither will she have any sickness during the nine months of gestation. "When her belly hurts" (i.e., the quickening), the woman goes to the same female *ocimbanda*, who paints lines of white, red, and black across her breast.

The *ocimbanda* gives the woman a necklace consisting of a strip of leather to which two cowries are attached. Experience proves that such a necklace is difficult to buy. If the woman has a necklace of this kind which was worn by her grandmother, it is a very powerful aid to conception, a relief in painful menstruation, and a means of securing easy delivery and normal gestation. I could not find any trace of an idea relating to the entry of a soul, ancestral or otherwise, into the foetus.

*Ongandu* is the name for a disease of the genitalia; but Ngonga used the word to describe abdominal pain suffered by a woman who has had no children. By this I suppose he means painful menstruation. The curative root which is given is called *kayambua*.

Abortion is never secured by mechanical means. The medicine (*ihemba*) is made from the root of a plant that is boiled in water and

drunk. The concoction is described in Umbundu as *ihemba vioku tundisapo imo* ("medicine to take away belly").

When the monthly period begins too early in life, the medicine-man recommends that the young girl should wear the cowrie necklace worn by her mother's mother.

A deformed child is destroyed, but not if it has been allowed to survive the first day.

If male triplets are born, two stay permanently with the mother. At the age of five years one child goes to the king, whose child he becomes.

When a woman has had relationships with more than one man, she will die in childbirth unless the medicine-man is called to cure her.

In a Vachokue village of eastern Angola I bought a female wooden figure. It was explained that this would be nursed by a woman, one of whose twins was dead, in order to induce another conception. Moreover, the nursing of the figure prevents the death of the second twin. The Ovimbundu also use these wooden figurines for replacing dead twins (p. 163).

Children are suckled for a long time; even those of three years and older come to the breast. There are instances in which milk is present but lacking the nutritive qualities; then the baby is likely to die. The matter is simpler when a mother gives no milk at all because the baby is given to another woman, but not necessarily to a woman who is suckling a child. A baby whose mother has no milk may be given to a woman who has not borne a child for many years, and the sucking of the child quickly induces a milk supply. This is agreed upon by informants at Ngalangi and Elende who have seen a child nursed by a woman with withered breasts. Protection is given to the fontanelle by covering it with a vegetable gum which hardens.

Near the chief village of the Vangangella at Ngalangi there is a mound decorated with feathers and painted wooden posts (Plate XCII, Fig. 1). Childless women are placed on the mound which is near a river. They are covered with mud, after which the medicine-man sings songs and administers potions. The women go home and are made to sit on mounds in their kitchens. These mounds, which are made in rows, like earth heaped up after hoeing a trench, may be a symbol of successful agriculture and human fertility.

On looking into the subject of blood brotherhood I found that an exchange of blood between two males who swore mutual fidelity was at one time common. At the present day an exchange of blood is

sometimes made between husband and wife, at night and in secret. People say that those who exchange blood will die at the same time.

#### NAMING

In addition to the words chosen to describe twins, there are some points of importance in connection with the naming of children. The father and mother change their names when the first child, male or female, is born, but there is no change of name at the birth of subsequent children. In a certain family the name of the first child, a girl, was Vitundo. The name of her father, which was Cingandu, was abandoned; he became Savitundo, "the father of Vitundo." The mother's name of Visolela was changed to Navitundo, "the mother of Vitundo."

If the first child dies, the parents dislike their names; they therefore revert to their original names. When another baby is born, the parents again change their names in the way described. A posthumous child is called Lusati. A child born after twins is Kasinda, which means "to push." Twins are called the Lion and the Elephant, or the Elephant and the Hippopotamus. There are no secret names. The names of the dead must not be mentioned; the deceased is referred to as "the one who has gone." Children may change their own names at the age of about sixteen years, and actually do so if their names are distasteful to them. Ngonga's friend, named Katito ("little"), changed his name to Mukayita (meaning not known). Ngonga's sister, named Ndumbila (meaning not known), changed her name to Cilingohenda, which means "It is a pity." I met a chief near Bailundu who was called Kandimba, meaning "the Little Hare."

There may be a change of name during sickness. A man now named Katahali suffered sickness in addition to other misfortunes. His sickness recurred, so he changed his name from Kopiongo to Katahali. The meaning of the former name is not known. The new name, Ka tala ohali, means "He who has seen trouble"; Katahali is an abbreviation. Another instance of change of name, also in the village of Cilembo, was that of a man who changed his name from Lumingo to Kaihemba, which means "the one who lives by medicine"; because without medicine he would have died. A sick child may receive a bad name, for instance, the name Pig. If one or more children have died a subsequent child receives an ugly name with a bad meaning. There is no totemism, but children may be named after animals. A girl is sometimes named Kambundu ("a little frog"). Other names for females are Esenje ("the rock where corn

is pounded") and Cisengu ("a small bird with a long tail"). A boy may be Kangwe ("the little leopard").

Names sometimes give an indication of descent. Ngonga's full name is Ngonga Kalei Liahuka, Ngonga ("eagle"), Kalei ("one who works for the king"), Liahuka (the father's surname). Ngonga's sister is Cinyañala ("the old basket"). This was the name of her father's father's sister. As the father of Cinyañala is Liahuka, the daughter is surnamed Yaliahuka (*ya*, "of"). The father chooses the names of the three first children whether boys or girls. The mother chooses the name of the fourth child whether male or female. If the child is a boy, the mother probably chooses the name of her brother or of her father's brother. When a first son is born, the father usually gives the name of his father; for example, Ngonga's father's father was Ngonga. If the first baby is a girl the father chooses the name of his sister. Ages are not known, but reckoning of age goes back five years by counting the number of times maize has been sown; maize is planted each October. The period from sowing to sowing is *ulima*.

If a man has a child by a woman who is not a wife or a concubine, the woman keeps the child for eight or ten years. The man must give the mother a cloth in which to carry her illegitimate baby, also oil for her hair. Sometimes the girl will go to the father of her child to be his concubine, but her parents will not let her do so if he has a bad reputation. To bear a child out of wedlock is a disgrace.

#### TERMS OF RELATIONSHIP

In preparing the following tables Ngonga was the ego, or male speaker, and each term is given in relation to himself, with its reciprocal. The tables give firstly Ngonga's own generation, then his ascendants, and finally some of his descendants. Tables E and F are diagrammatic forms of tables A-D.

##### TABLE A

(See Table E III)

##### NGONGA'S OWN GENERATION

Terms in italics are Umbundu names either for persons or for kindred classes. Reciprocals are placed in brackets; W.S. means, "woman speaking."

*Ukai wange* is my wife; *uketu*, which means "spouse," is a modern form of address for husbands and wives when speaking to each other (*veyange*, my husband).

*Kota* or *huva* is my elder brother (*mume wange* or *manja*, younger brother).

*Kota* or *huvange* is my elder sister. An elder brother speaking to his sister calls her by name, or he uses the term *mbuale*. When speaking of her he says *mukai wange* (*mume wange* or *manjange*, younger brother). The same terms are used in the same way to apply to my father's brother's son, and my

father's brother's daughter. Similarly the terms *manja* or *kola* are applied to my mother's sister's son. The former is used if this relative is younger than myself; the latter term is employed if the relative is older than myself. *Mukai* is the term for my mother's sister's daughter (reciprocal, *manja*, *kola*, or *kuwa*, means mother's sister's son). *Manjange* is a general name for a mother's sister's child, male or female.

*Upalume* describes my father's sister's son (*upalume*, mother's brother's son). The word is also applied to my father's sister's daughter. Marriage with a father's sister's daughter is permissible, but it is not favored since the offspring of such a union may be stupid. *Upalume* also designates my mother's brother's daughter, who, according to custom, is regarded as the most suitable spouse for me.

*Cepua cange*. This term is applied to any child of my mother's brother and to any child of my father's sister (reciprocal, *cepua cange*).

*Nawa*. The term is used as follows: for my elder brother's wife; (W.S.) my husband's younger brother; my younger brother's wife; (W.S.) my husband's elder brother; my elder sister's husband; my wife's younger brother; my younger sister's husband; my wife's elder brother; my father's brother's son's wife; (W.S.) my husband's father's brother's son; my father's brother's daughter's husband; my wife's father's brother's son; my father's sister's son's wife; (W.S.) my husband's mother's brother's son; my father's sister's daughter's husband; my wife's mother's brother's son; my mother's brother's son's wife; (W.S.) my husband's father's sister's son; my mother's brother's daughter's husband; my wife's father's sister's son; my mother's sister's son's wife; (W.S.) my husband's mother's sister's son; my mother's sister's daughter's husband, my wife's mother's sister's son.

This completes the terms of relationship for Ngonga's own generation.

#### TABLE B

(See Table E II and IV, also Table F II)

##### FIRST GENERATION OF NGONGA'S ASCENDANTS

*Tale*. The term is applied to my father; my father's brother; and my mother's sister's husband (the word *omolange*, my child, is the Umbundu reciprocal for the English reciprocal terms, son, brother's son, wife's sister's son).

*Mai*. The word is applied to my uterine mother, my mother's sister, and my father's brother's wife (again the Umbundu *omolange* is the reciprocal for the English reciprocals, son, sister's son, and [W.S.] husband's brother's son).

*Aphai* means my father's sister, and the term is said to designate a "female father." My mother's brother's wife is also *aphai* (the Umbundu reciprocal for either male or female is *ocimumba cange*, which is the equivalent of the English reciprocals, brother's son and husband's sister's son).

*Manu* or *inanu* is my mother's brother (reciprocal is *ocimumba cange*, which means sister's son).

*Cikulume*. The term is applied to my father's sister's husband (the reciprocal, *ocimumba cange*, means wife's brother's son).

This completes the first generation of Ngonga's ascendants.

#### TABLE C

(See Table E I and F I)

##### SECOND GENERATION OF NGONGA'S ASCENDANTS

*Sekulu yange*. The term is applied to my father's father, and literally means my older father (the reciprocal is *onekulu yange*, meaning son's son).

*Sekulu*. The word designates my mother's mother's brother, and my mother's mother's sister's husband (the reciprocal, *onekulu*, means sister's daughter's son, and wife's sister's daughter's son).

*Kukululu* or *sekululu*. These terms are applicable to my father's father's brother, my father's father's brother's wife; my father's father's sister's husband; and my mother's father (the reciprocal *onekulu* describes the reciprocals, brother's son's son; husband's brother's son's son; wife's brother's son's son; daughter's son).

*Maikulu*. This designation, which is derived from *mai*, meaning mother, and *kulu*, an old person, is applied to my father's mother (reciprocal, *onekulu yange*, son's son). *Maikulu* also means my father's father's sister; my mother's mother; my mother's mother's brother's wife; and my mother's mother's sister (the reciprocal is *onekulu* which equals the English reciprocals brother's son's son; daughter's son; husband's daughter's child; and sister's daughter's child).

This completes the second generation of ascendants.

NOTE: Ngonga's wife uses the names *maikulu* and *kukululu* for those relatives of her husband to whom Ngonga himself applies those terms. These relatives call Ngonga's wife *onekulu*.

#### TABLE D

(See Table E IV and V, also Table F II, IV and V)

##### SOME OF NGONGA'S DESCENDANTS

*Nunulu* or *uweli* is my first-born son. Other sons are *omola*, meaning child. *Omola ulume* means a male child. *Omola ukai* is a female child. *Uveli* also means a first daughter (the reciprocal for these terms is *tate*, meaning father).

*Omolange* means my child. I apply the word, not only to my own children, but to my elder brother's son (reciprocal, *tate*, father's younger brother); to my elder brother's daughter; and to my younger brother's son.

*Ndateambo*. The word is applied to my son's wife; my daughter's husband; my elder brother's son's wife; my elder brother's daughter's husband; and my younger brother's son's wife (the same word *ndateambo* is used for the reciprocals of these terms; namely, husband's father; wife's father; husband's father's younger brother; wife's father's younger brother; and husband's father's elder brother).

The foregoing classificatory system of relationship is not peculiar to the Ovimbundu, but is a cultural trait of many Bantu-speaking and some Sudanic-speaking Negroes. The similarity of the Umbundu system to those of surrounding peoples in Rhodesia and the Congo will be pointed out in chapters dealing with culture contacts.

When describing marriage rites reference was made to the fact that a wife goes to live near her husband's relatives; the system is therefore patrilocal. The limited family consists of husband and wife (or wives) with their children. The greatest number of wives observed in the family of a commoner was four, and in the family of a king eleven. A household sometimes contains adopted children, also domestic slaves (pawns) who are working to pay off debts for their maternal uncles. An extended family may include a grandfather and his wife, his sons, their wives and children, and his unmarried daughters, with classes and nomenclatures mentioned in the foregoing tables.

The phrase *epata lia tate* (or *aluse*) means "family of my father" and includes all relatives on the father's side. The words *epata lia*

*mai* (or *oluina*) mean "family of my mother." These terms seem to indicate a bilateral rather than a unilateral lineage. Inquiry did not show that there were totems for the mother's or the father's people, or that marriage into any particular local group was commanded or enjoined. A village is a unit under the administration of a chief (*sekulu*) and as such is part of a large group of villages forming a kingdom ruled by a king (*osoma*), but such village units are concerned with government and warfare, not with exogamy.

In tracing descent an Ocimbundu gives the names of relatives of both the father and mother, but commoners are unlikely to know the names of their relatives beyond the grandparent class. The children of a king were at one time able to recite many generations of ancestors along both parental lines. But if the king had married a commoner, as he was allowed to do after choosing his first wife from the royal line, the children knew only the genealogy of their father. This is obvious since the commoner mother would not be likely to know her line of descent. The son of a village chief (*sekulu*) may marry a commoner, but, according to Ngonga, the *sekulu*, his father, "would have a very good look at her."

Ngonga had not heard of the marriage of brothers and sisters, not even in the royal family; the idea of such a union was new and repulsive to him. In Umbundu society there would be no necessity for such a marriage as that of brother and sister or other close relative, because members of a royal family of one part of the country could intermarry with members of a royal family in some area far away. There might, for example, be marriages between the royal families of Bailundu and Ngalangi, which are two principal kingships of the Ovimbundu confederacy.

When asked what would be the fate of a man who committed incest with his blood daughter or uterine sister, Ngonga said he would be killed by his brother or by his mother's brother. If he escaped he would have to go far away so that his people could never see him again. If a fine were accepted for incest, the culprit would have to pay his own kin "because he had shamed them."

Table A, Ngonga's Own Generation, calls attention to a plurality of terms for brother and sister according to the relative ages of the speaker and the person addressed. Moreover, there is a term for direct address and another which is used when speaking of a brother or sister.

Ngonga was questioned with regard to forms of address for his brothers and sisters other than the children of his uterine mother.

Ngonga actually has a brother by his father's first wife, and for this male he uses the same terms as for his uterine brothers. The same terms are used for uterine sisters and sisters begotten by his father through wives other than his uterine mother. Ngonga said, "If people ask you which sister or which brother you can explain it in words."

A wife of Ngonga's father, other than Ngonga's uterine mother, is called *mai yesepakai*; that is, "the mother who is jealous of my mother." *Mai* means "mother," and the remainder of the term is a derivative from the word *esepa*, meaning "woman's jealousy." If two women A and B desire to marry the same man and only A is successful, B calls A *sepakai*. Under similar circumstances a man would call his successful rival *cikuelume cove*.

There is a distinct word for man's jealousy. In explaining this Ngonga said, "When I see my wife look at another man, I have *ukuelume* ['man's jealousy'] in my heart."

If on the death of Ngonga's father, his mother married again this male would be called by Ngonga *tate yesepakai* ("the father who is jealous").

A wife calls the children of the family, who are not her own, *omala vesepakai*; that is, "the children who are jealous of the other children." A mother-in-law taboo operates. Conversation between mother-in-law and son-in-law must always be carried on while the speakers stand back to back.

The foregoing note on a mother-in-law taboo has been supplemented by a letter from Dr. Merlin W. Ennis of Elende, Angola (August, 1931). "Mother-in-law and father-in-law taboos seem to be directed against seeing each other. The persons involved may not see each other. If they meet on the path, one steps aside and turns the back while the other passes on. The one passing by goes through the motions of seeing no one. If it is necessary to converse on some subject, they sit looking in different directions, or one sits out of doors and the other within, around the corner of the door. This holds equally for a man and his son's wife, and for a woman and her daughter's husband. A man may see and talk with his daughter's husband, and a woman may see and speak to her son's wife, but no son-in-law may eat with a father-in-law, likewise daughters-in-law and mothers-in-law may not eat together. Brothers-in-law may not eat together unless they have gone through a certain ceremony; this also holds for sisters-in-law."

Table A indicates a wide use of the word *nawa* for "in laws" of the speaker's generation. Thus Ngonga calls the wives and husbands of his brothers and sisters *nawa* without distinguishing them in any way. The term *nawa* has a still wider connotation for it includes Ngonga's father's brother's son's wife, and his father's sister's daughter's husband. Ngonga's wife said that she uses the word *nawa* for all the brothers and sisters of her husband, for all the children of her husband's father's brother, her husband's father's sister's children, her husband's mother's brother's children, and her husband's mother's sister's children. Reciprocally, all these people call Ngonga's wife *nawa*.

Table A introduces the question of cross-cousin marriage, which is the functional form among the Ovimbundu. My informant said that he calls his mother's sister's children brothers and sisters, therefore he could not marry the girls. Neither are his father's brother's daughters eligible for marriage with him. The table shows the truth of this, for Ngonga calls his father's brother's daughter *mukai*, meaning "sister"; she addresses him as *kota* or *huwa* ("brother"). Ngonga also addresses his father's brother's son by the term *manjange* ("younger brother") or *huvange* ("older brother") according to the relative ages of the speaker and the person addressed.

When Ngonga was asked whether he could marry a daughter of his mother's brother, he replied, "I could marry her very well indeed." A marriage of Ngonga with his father's sister's daughter would be permissible but Ngonga said the marriage is not regarded as a good one "because the children will be stupid." Ngonga could marry his mother's brother's daughter's daughter, or his mother's brother's son's daughter. It would also be permissible for Ngonga to marry his father's sister's daughter's daughter, or his father's sister's son's daughter.

Ngonga said, "My father's brother is my father, and my mother's sister is my mother." When questioned further my informant said that a marriage with daughters of these relatives would make him *ocinyama*, which means "an animal." Relatives would say, "You have shamed the family." It will be noted from Table B, First Generation of Ngonga's Ascendants, that Ngonga's father's brother calls him *omolange*, meaning "my child," for which the reciprocal is *tate* ("father"). Ngonga's father's brother's wife is *mai* ("mother"), and she calls him *omolange* ("my child"). Ngonga distinguishes between his mother's oldest sister (*mai yukululu*), and his mother's

youngest sister (*mai yumalele*). Ngonga's father's oldest brother is *tate yukulu*.

Thus far Ngonga was clear about his eligibility for marriage, and in addition to this he was sure that he could not marry a sister of his wife while his wife was alive, but he could marry his wife's sister, after the death of his wife. The wives of a deceased elder brother are divided among his younger brothers, or a man may inherit the wife of his mother's brother. Ngonga always laughed heartily at the idea of marrying a woman much older than himself. He did not know whether he could marry certain older people of the *ndatembo* and *maikulu* class but thought the idea amusing because of their age.

In discussing law, inheritance, and slavery, the importance of the mother's brother will be indicated, and for this relative there is the term *manu* (or *inanu*). The *manu* calls Ngonga *ocimumba cange*, but he calls Ngonga's wife *ndatembo*. Ngonga's mother's brother's wife, also Ngonga's father's sister, are *aphai*, which my informant interpreted as a "female father."

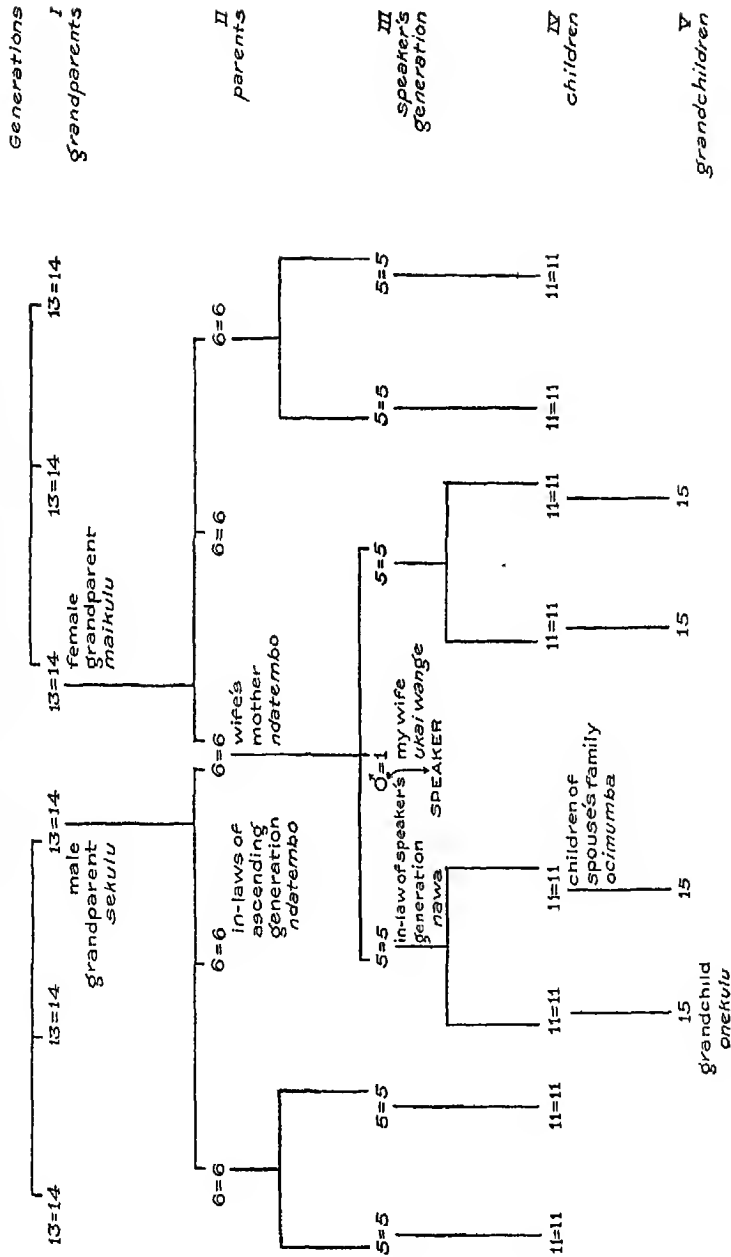

The use of the word *nawa* has been explained in such a way as to show that Ngonga's wife uses this term for a large class of relatives by marriage who are of the same generation as her husband, while these people reciprocally use the word *nawa*. Ngonga uses the word *nawa* in exactly the same way for corresponding relatives of his wife.

This term *nawa* is not to be confused with the term *ndatembo* whose connotation is indicated by the following examples. The wife of Ngonga applies the term *ndatembo* to certain of her husband's relations who are not of his generation. Thus she calls Ngonga's mother *ndatembo* when speaking of her, but she addresses her mother-in-law as *mai* ("mother"), while *ndatembo* describes the relationship between Ngonga's wife and his father. Moreover, Ngonga's wife uses *ndatembo* to describe her husband's father's brother's wife, and Ngonga's wife is called *ndatembo* by her husband's father's sister, her husband's father's sister's husband, and her husband's mother's brother. These are relatives by marriage but they are not of the same generation as her husband.

Table C, Second Generation of Ngonga's Ascendants, gives no particular difficulty. *Maikulu* includes the paternal grandmother, the father's father's sister (great aunt), the maternal grandmother, the mother's mother's brother's wife, and the mother's mother's sister. Therefore *maikulu* is a class name for the second generation of female ascendants.

TABLE F  
DIRECT LINE OF RELATIONSHIPS OF SPEAKER'S WIFE

*Sekulu* includes the father's father, the mother's mother's brother, and the mother's mother's sister's husband. The terms *sekululu* and *kukululu* were used by Ngonga as being synonymous, and therefore they have the same connotation. With regard to the term *maikulu* Ngonga seemed clear, but in reply to questions concerning the reason for having the terms *kukululu* and *sekululu*, he was evidently confused. At last he said, "It does not matter, they are the same people." Ngonga never hesitated in giving the reciprocal for all these terms, which is in every instance *onekulu*. These terms may have been correlated with different functions which have now become obsolete.

The two most important collateral relatives in the parent's generation are the father's sister (*aphai*) and the mother's brother (*manu*). The term for father's sister means "female father." As such her relations to ego are similar to those of a father, consequently it is not considered right to marry her daughters. The mother's brother, on the other hand, is without doubt ego's most important relative. The two are linked by a series of reciprocal duties and obligations. Marriage of a mother's brother's daughter, or a mother's brother's widow, is a correct procedure. The value of the more important reciprocal duties is indicated in the following sections on law and government.

There was no possibility of devoting more time to the matter of relationship terms, but there is here sufficient to indicate the remarkable persistence of the kinship system in spite of three centuries of contact with the Portuguese and other Europeans. Moreover, the information gleaned by interrogation of Ngonga and his wife gives the main points for comparison with systems of a similar kind that have been given for Ashanti, Uganda, and Rhodesia, by Rattray, Roscoe, and Smith and Dale respectively. These kinship systems are the same both in general principles and in considerable detail.

The foregoing notes and tables were studied by Mr. Zachary Taylor of the University of Chicago, who prepared Tables E and F. Mr. F. Eggan offered useful criticisms. The Arabic numerals on these charts refer to the numbers used to designate terms of relationship on the list on page 199. The ego or speaker is Ngonga, my interpreter, whose direct line of relationships is shown in Table E, while Table F indicates the terms used by Ngonga for his wife's relatives. The levels numbered in Roman numerals on Tables E and F indicate the generation stratification as follows:

- I. Grandparents.
- II. Parents.
- III. Speaker's generation.
- IV. Children.
- V. Grandchildren.

Numbers on the left of the sign (=) refer to males, those on the right, to females.

The terms of relationship used in Tables E and F are as follows:

- |   |   |
|---|---|
| 1. <i>Ukai wange</i> . My wife (vocative).<br>Ngonga's wife calls him <i>veyange</i> ,<br>my husband. | 11. <i>Ocimumba</i> . Children of spouse's<br>family.                                   |
| 2. <i>Mume, manja, manjange</i> . Younger<br>brother.   | 12. <i>Manu, inanu</i> . Mother's brother<br>(direct ascendant).                        |
| 3. <i>Kola, huwa</i> . Older brother.   | 13. <i>Kulu</i> . An old person in grand-<br>parent's and grandchild's genera-<br>tion. |
| 4. <i>Mbwale</i> . Sister (vocative).<br><i>Mukai wange</i> . Sister (nonvocative).                   | <i>Sekulu, kukululu</i> . Male grand-<br>parents.                                       |
| 5. <i>Nawa</i> . In-laws of speaker's genera-<br>tion.  | 14. <i>Maikulu</i> . Female grandparents.   |
| 6. <i>Ndalembo</i> . In-laws of ascending or<br>descending generation.                                | 15. <i>Onekulu</i> . Grandchild of either sex.  |
| 7. <i>Tate</i> . Father.  | 16. <i>Upalume</i> . Mother's brother's or<br>father's sister's children.               |
| 8. <i>Mai</i> . Mother.   | 17. <i>Cikulume</i> . Father's sister's hus-<br>band.                                   |
| 9. <i>Aphai</i> . Father's sister (female<br>father).   |   |
| 10. <i>Omolange</i> . Child, used for speaker's<br>family only.                                       | NOTE: Age distinctions are made chiefly<br>in the speaker's own generation.             |

### LAW AND GOVERNMENT

In dealing with marriage rites it was stated that a woman had to contribute certain articles to the home; these are the utensils that she uses in her daily work. The baskets, pottery, pounders, and brushes may seem insignificant, but nevertheless there are rules regulating their disposal at death. Her husband will retain some of the articles; the remainder will be shared among the deceased woman's sisters.

The disposal of a widow is a matter for discussion among the relatives. The husband makes no bequest to his widow and children, though the children may receive a small gift of a pig or some corn. The property of a man is bequeathed to his mother's brother or to his sister's sons. The eldest brother of the deceased or the maternal uncle of the widow takes her to his house along with her children. If her father is alive he may take her. Ngonga says that each responsible relative says, "It is better that you should take her"; at last some one says, "I will take her."

When explaining the system of inheritance Ngonga was clear on two points. In the first place wives and children of the deceased are

not entitled to inheritance of land, cattle, or anything else belonging to the dead man. The greater part of the property would be bequeathed to the eldest brother of the deceased's mother.

There appears to be discussion as to the distribution of property, but the maternal uncle is responsible for settling disputes. He himself has the first claim, and in Ngonga's words, "If there are quarrels about the cattle, land, and other things, the mother's eldest brother will settle them."

The mother's brother has rights over his sister's children even to the extent of pawning them to pay his own debts. On the other hand the maternal uncle is responsible for the conduct of his sister's children. He would have to pay fines incurred by thefts they committed, and he provides for his sister's son a wife who is either his daughter or his widow.

Ngonga stated that the maternal uncle does not invariably take all the property of a deceased nephew for himself. He may give something to the deceased's mother, the deceased's maternal grandfather, or to a brother of the deceased. Such gifts appear to be the outcome of good will on the part of the dead man's maternal uncle; there is no compulsion. Women never inherit cattle or rights to the use of land.

The king is the head of the legal system, though his activities as such are not so great as those of the village headman (*sekulu*). The *olosekulu* (there are usually more than one) of a village witness the final act in a divorce ceremony. They used to have charge of trials for theft, murder, adultery, likewise the right of settling arguments concerning the ownership of land. It was the *sekulu* who distributed the land to the extended families when a new village site was opened. The maternal uncles settled the minor divisions among the limited families.

There are many kings among the Ovimbundu, but I thought that there was a tendency to confuse the titles of *osoma* ("king") and *sekulu* ("headman" or "chief" of a village). The jurisdiction of a king is so well known that any person is able to say under which king he lives. Ngonga said definitely that a man of the Ovimbundu who was under the jurisdiction of a certain king would have to obey the commands of a visiting king, provided they were not in any way disapproved of by the king to whom first allegiance was due.

A chief may demand labor for the building of his house or the cultivation of his land. He does not pay for this but usually gives beer to the workers; sometimes he secures the labor and gives nothing

in return. Even a slave used to have rights of appeal to the king if he were starved and beaten without cause. The king was the prime mover in warfare. The whole legal system is at this time directly under Portuguese administration though the kings and chiefs have minor powers. Ngonga says that complainants who are dissatisfied with the decision of their own chief go to the Fort, meaning of course the Portuguese military post, or office of the Administrador.

There is no doubt that in former days the responsibility for crime and debt was transferred to a relative in the absence of the delinquent. If a thief escaped, responsibility would rest with a brother, a father or a son. The mother's brother was often held to be responsible for the misdeeds and debts of his sister's children. The mother's brother has rights that extend to the sale of his sister's children to pay his debts. For this reason Ngonga says, "If I have done wrong and they cannot catch me it is right that he (mother's brother) should pay for me."

I supposed the case of Ngonga having stolen a cow; he has been caught but escapes. Ngonga said that the man from whom he had stolen the animal would go to his (Ngonga's) mother's brother in order to name the price required for the cow, or any other possession which had been stolen. If the mother's brother thought the price reasonable he would pay. On the contrary, if the price claimed were too high the mother's brother would appeal, first to the village chief, then if necessary to the king.

Ownership of land does not appear to have been a source of dispute. Apparently land was distributed by the chief as explained in dealing with village organization. Rights seem to have been well defined and there was always enough land for a stranger. When a man was going away on a trading journey he might lend his land to another who would agree to cultivate it and take the produce for a year. I was unable to satisfy myself that land is now, or was in time past held to be the property of dead ancestors. The right to land depends on its use and allotment by a chief at the time of founding a village. A man who intended to be absent would make a payment so that he might leave his goods at the house of another. The chief would settle any disputes arising from these arrangements.

The complainant in a suit is called *ombile*, the defendant is *ovilue*. The name for a witness is *uwangi*. In the old days a false witness had to make recompense to the man about whom he had told a lie; he would probably have a beating as well. A master was in every way responsible for the actions of a slave. The degree of responsi-

bility of women is mentioned in describing the penalties for adultery and theft.

The penalties for offences against the king were undoubtedly more severe than those imposed for the same offences against a commoner. Ngonga says that the punishments for crimes against a chief or medicine-man were, and are now, the same as the penalties for offences against any other person. It seems, however, that if the chief were a very powerful man, he could claim penalties which would have been appropriate for offences against a king.

A thief was punished by beating, in addition to which he would have to pay a fine to the people from whom he had stolen, but he rarely escaped without the beating. The thief would be beaten just as much for stealing one animal as he would for stealing many. If a woman stole from her neighbor's garden, those who caught her would tie her and take her to her husband, who would pay compensation and then beat her. A child caught stealing would be taken to the maternal uncle or to his own father. If a woman stole from relations she would probably have no punishment other than a beating. Her husband would have to compensate the relations. Stealing honey from hives is an offence that is punished according to the general laws relating to theft.

If a man was sentenced to a death penalty, or to a beating, there was an official appointed by the king or by the chief to see the sentence carried out. This representative was called *ukuenje welombe* which means "the servant, or minister, of the court."

Ngonga described the penalty for murder saying, "It was a terrible thing they did to the murderer. A tight triangle of wood was fastened on to his neck by a peg and to this a cord was attached so that he was suspended to the roof with his feet barely touching the ground. In some instances his head was placed through a hole in the door of his house while his body was inside the hut. He had very little food or water and people threw things at him. He was kept tied up for a month to see whether he could pay something. Suppose he could not pay, and nobody would pay for him, he was taken outside the village where his head was cut off. If he had many possessions, he said on the first day, 'If you will take this thing off my neck I will pay two oxen and two slaves.' The payment would be made, not to the wife or children of the murdered man, but to the brother of the mother of the murdered man, or to the mother of the murdered man, or to the son of a sister of the victim. If the murderer agreed to make the payment the people kept him tied up until the

finer were in their hands. If he murdered one of the royal family he was killed after he had paid the fine." The punishment of a woman who has committed a murder is the same as that for a man.

*Ombulungu* is the name given to trial by poison ordeal. The medicine-man holds out both his hands, in each of which there is a potato, only one of which is poisoned. The accused man says, "If I have done this thing, this potato will be poison for me. If I have not done this thing, this potato will be food for me." The complainant says, "If this is not the man who poisoned my brother, this potato will be poison for me." They sit in front of the medicine-man, and each must take the potato in the hand opposite to him. The poison makes a man very sick. His mouth swells so that he cannot speak.

When a woman was accused of murder her son or her brother would take her place in the poison ordeal. A boy of fifteen years of age would have the same treatment as a man. "I don't think a girl would kill anybody. I never heard about it," said Ngonga. It appears that resort was made to a medicine-man when the accused was thought to have committed murder by poison or magic. If the murderer used weapons, the accuser, who was usually a relative, was entitled to kill him with the kind of weapon used for the crime.

The penalties for adultery were the same as those for murder. The woman appears to have escaped punishment, except that "her husband would not have her any more." The male adulterer had to pay the husband; if he could not pay or escape, the husband had the right to kill him. In the old days the price for adultery was two oxen, a pig, and a slave. At the present day a man who has committed adultery and made payment, possibly takes the woman and all children under three years of age. The husband has the right to decide whether the adulterer has the privilege of taking the woman and her children. An adulterer with one of the king's wives was castrated but not killed. He might, instead of mutilation, pay a very high price, while he himself along with his sisters and the sons of his sisters, would become slaves of the king. If a man could not pay, he might be sold as a slave in order to provide money for the fine. Criminal law did not distinguish between responsibility for intentional and unintentional offences.

It is very difficult to say how much of the old law survives. One feels that underneath the ostensible Portuguese rule there is an active native life that is resisting subjugation.

Only two years ago Ngonga paid an ox to prevent one of his female relatives from being pawned. Within the past ten years Ngonga has

actually paid to redeem his brother and sister who were sold to pay the debts of his maternal uncle. Officialdom is one thing and actual practice is another. Ngonga is right when he says that people appeal to the native law as laid down by the chief or king. If they are not satisfied they pretend a great respect for Portuguese law and therefore go to the Administrador.

#### WARFARE AND SLAVERY

The Ovimbundu have been for centuries an organized people possessed of a well-developed language, a legal system, and complex social organization. In trade and travel too, the Ovimbundu have been in the vanguard of African tribes. These reasons, in conjunction with the fact of numerical superiority and early contact with the Portuguese, would account for the success of the Ovimbundu in warfare. The defensive federations existing between the ten or twelve main political units, whereby they did not habitually war on each other, helped to assure success. Should the eldest son of a king's principal wife be thought unsuitable as successor, a competent son of the deceased king was elected by a council of village chiefs.

There is no evidence that the Ovimbundu poisoned their weapons, neither do they do so today. The Ovimbundu do not use a shield at the present time, neither is it certain that they had shields in former times. A skin-covered powder-box was carried in the king's train when on the warpath.

Signaling-drums were about two feet long. They were made from a cylinder of wood over the ends of which skin was stretched. Signaling, which was accomplished by drumming with the palms of the hands, was the task of boys who resided in the king's compound, except when they accompanied him to war or on a trading journey. There was no system of smoke signaling. The iron war gong was named *ongonge*, but the instrument is nowadays tapped by the assistant of a medicine-man during his performance. In former times the gong was struck in the night to give assurance that the enemy was not in sight.

In war the oldest son of a king or of a chief went ahead of the war party accompanied by a few men who wore red leaves on their foreheads.

Intertribal jealousies, raiding for cattle and slaves, also reprisals for interference with caravan trade, were the chief causes of conflict with surrounding peoples. There was undoubtedly some internal warfare within the confederacy. The Ovimbundu of Elende, Bail-

undu, and Ngalangi are said to have had conflicts. In time past, as at the present day, a king reigned over territory which was extensive but definitely delimited for purposes of administration. Encroachment of one king on the rights of taxation and administration of another led to raids and reprisals. Village chiefs collected taxes in the form of agricultural produce and gave these to the king, who personally visited a village from which payments had not been made. A folklore story begins, "The people had not paid taxes so the king came to the village and told them a parable."

A king, if young, accompanied his people on the warpath. There was, however, a permanent leader named *kesongo*, a derivative from *songola* ("to lead"). The declaration of war, likewise the tactics, were discussed by a council of *olosekulu* ("village chiefs") in the *ombala* ("capital") where the king had, and still has, a royal compound. If war had been conducted among sections of the Ovimbundu, the defeated people had to pay taxes and tribute; moreover, their women and cattle were taken. In event of a successful war against the Vachokue there was plundering of cattle and women, but it was not found practicable to exact periodical payments from the enemy.

The subject of warfare is intimately related to that of slavery. There was until very recent times a domestic slavery which followed from the inability of a person to pay his debts. In connection with this reduction of free persons to a condition of slavery there are several points of exceptional interest. The debtor himself is not taken as a slave, neither are his wife or children. The correct procedure is a sale of his sister's children; but more frequently the children themselves are taken by the creditor. "The debtor's sister will say nothing because this is the law of the Ovimbundu." If payment of the debt is made later, the children are set free. Usually the word pawning is used by ethnologists to describe this proceeding.

Further consideration of Ngonga's payment to his mother's brother clarifies the facts of domestic slavery. "I paid for them, I took their place," said my interpreter. The payment for the return of these two children was two oxen. The girl, who was ten years of age when she was taken to pay the debt, was returned to her people when she was a woman with three children. Ngonga's brother was not actually taken from his home. He was made to pay his mother's brother's debt by working for the creditor. In general, these domestic slaves were not ill treated, though their rights were limited. The position of slaves taken from a hostile

people, especially if they were from outside the Ovimbundu, was one of absolute and abject servitude.

The master had rights of punishment including a death sentence; but Ngonga says that a slave could appeal to the headman of the village if he were starved and cruelly treated. All children of a slave became slaves of the master. As the slave had no property he could not pay a fine; the master would pay the fine then relieve his feelings by beating the slave. Instead of paying the fine the master might sell the slave.

Slaves were not branded or marked in any way. Ngonga has seen runaway slaves hunted with dogs. A slave was not allowed to buy his own freedom. A master could dispose of his slave girls in marriage; for instance, a young girl might be sold to an old man. The condition of the slave is well expressed in Ngonga's own words: "The slave worked hard at everything, then the master said he had done nothing."

Slaves used to go to war to fight with their masters against an enemy. A slave might become a blacksmith or a hunter, two very esteemed occupations, but all his work would be for the master. Ngonga says there was no slave market belonging to the Ovimbundu, but every man knew where he could buy a slave. Slaves could act as witnesses in a trial. Slave women were not lent out for prostitution. A slave owner did not have promiscuous intercourse with his slave women, but he chose two or three girls as concubines. A slave girl who was married to a free man would revert to her master along with her children when her husband died. If a master had married his own slave woman she would, at his death, become the property of his eldest brother and her children would go with her. In some instances the slave woman and her children would be given to the son of her master's brother.

#### VILLAGE ORGANIZATION

When choosing a site for a new village, a preference is shown for a hillside, though woods or valleys are at times selected. The foot of cliffs is a favorite site. In addition to the shade afforded by the cliff there was in time past the advantage of being hidden from the view of enemies. Further shelter was afforded by the planting of wild fig trees. Sometimes an *ombala* ("capital") was rendered picturesque by the planting of trees which grow to a great size; such a plan was followed at the *ombala* of Ngalangi.

Caves in the wall of a cliff, likewise rugged hillsides, gave a place of retreat for women and children during an attack. Usually there

are small streams of pure water falling down the cliffs and hillsides. Near Bailundu and Ngalangi, villages still retain their defences which consist of high poles set in a trench.

Judging from sites visited at Elende there was a pre-Ovimbundu stone-building culture. One of the sites has such a commanding view over extensive plains and valleys that the position would be almost impregnable. At the present day the line of fortifications is well marked by stone walls three feet high. These are composed of boulders to which the builders had ready access on adjacent hillsides. Large stones were no doubt rolled from the slopes to the small plateau chosen as a building site. This small plain lies midway between the hill crest and the valley.

At present this old site, which is enclosed by lichen-covered walls, is overgrown by tall grass and trees attaining twenty feet in height. Photography would be uninformative unless a preliminary clearance were made—a formidable task owing to the density of vegetation.

In the center of the enclosure is a group of transported boulders possibly marking the site of a place of assembly. A search among the long grass reveals stone slabs and cylindrical crushers which were used for grinding grain over a very long period, as may be seen by the wear on the base stone; some thick stones are so worn as to be almost perforated. Weather-worn stones that were probably used as scrapers, are to be found. Surface potsherds are of the material of which present-day Ovimbundu women make their cooking pots. These sherds mark the places now used by small nomadic bands, hence the surface pottery may have no connection with a pre-Umbundu culture.

In the vicinity of this walled stone village are hillside cairns marking the sites of graves. These have been robbed by medicine-men in search of material for their charms.

The Ovimbundu have no traditions regarding the site, neither is there legendary or other evidence to show that the Ovimbundu ever made their villages of stone. The raising of a cairn of stones over the body of a hunter is, however, a present-day practice near Ganda and in the Esole country.

If a site cannot be systematically worked, it is better left alone until scientific investigation is possible. The preliminary clearance of grass and timber would be a long process. The archaeological material recovered from such a site would be of a uniform and simple kind. There is no evidence of anything beyond an elementary stone age culture.

At the present time one type of village is surrounded by stout stakes ten or more feet high set in a roughly circular plan. The arrangement of alleyways within the village is complicated without following any symmetrical plan. A visitor sees only a labyrinth of passages between high poles, with here and there a rectangular wooden gate at intervals along the passages. The door itself is made from four stout heavy planks which are roughly hewn and as a rule undecorated, but occasionally I have seen the panels of a door carved with designs representing the breasts of a woman; or there may have been simple geometrical patterns. The top ends of the door panels are massive spheres of wood bored through with holes. Through the holes in the tops of these panels a pintle is passed in such a way that the door is suspended from above. During the daytime the lower ends of the panels are raised to the level of the lintel. They are there supported on a Y-shaped upright which is erected in front of the doorway. At night the planks are removed from this support and allowed to hang downward in the doorway. There is a sliding cross-piece to push over the lower ends. The same arrangement is sometimes used to make a door for a hut. This old type of village doorway, common twenty years ago, is becoming increasingly rare.

The house of a king or a chief is larger than that of a commoner. The enclosure which contains a king's house and the other buildings is named *elombe*, while *epandavillo* is the word used to describe the entrance to this compound. The *elombe* is built by men and women who receive no payment. There is a ceremony when the compound is opened. The house of the chief, Kandimba Sanjahulu, near Bailundu, is rectangular, with mud walls raised on a platform of earth and stones. Whitewash has been applied to the outside of the walls and some ornament is given in the form of painted blue crosses. Complete study of structural types and the planning of internal divisions has been made by F. and W. Jaspert, of the Städtisches Völkermuseum, Frankfurt.

At a village near Cuma the house of the chief differed from the dwellings of commoners in being somewhat larger. The house had been abandoned, not because the chief died there, but because the chieftainship had been transferred to an adjacent village. The tomb, which will be described in connection with funeral rites, was a few yards from the house. This mausoleum was surrounded by a high wooden palisade, to a stake of which were attached the horns of an ox killed at the funeral feast, while the jawbone lay in the enclosure

(Plate XLV, Fig. 2). The house of bows for holding sacred relics will be described in connection with religion (Plate XLVI, Fig. 1).

In former days there used to be a hard mud floor for dancing, centrally placed in the village.

In the center of the village is the communal house where all men, and boys over four years of age, gather to eat their food, which is sent by the women. This *onjango* is the place of assembly for discussion of village affairs. A house of this kind at Bailundu is circular in form with a diameter of seventeen feet (Plate XLVIII, Fig. 1). In the middle of the *onjango* are stones forming a fireplace. In another such house there were jawbones of oxen. These were suspended from the walls as tokens of the payment of fines. There is no communal house for females. In some villages there is a common kraal for cattle.

The king's compound usually contains:

- (1) The king's house, which invariably has a separate sleeping room.
- (2) A house and kitchen for each of his wives.
- (3) A tomb for the burial of kings and their wives.
- (4) The house of bows for staffs, bows, mats, and tobacco-pipes of dead chiefs.
- (5) A house of meditation for the king (Plate LXXXIX, Fig. 1).
- (6) Pens for pigs and chickens.

The guest houses (Plate XLVIII, Fig. 2) that I have seen were not in the king's compound. Granaries, which are conspicuous in every village, have been mentioned in connection with food supply (Plate XLIV, Fig. 1). Each house has its own granary. I have noticed garbage pits containing corn husks and refuse from sweet potatoes, but there is as a rule no organized scheme for disposing of refuse; dogs and pigs are the scavengers. There is no particular place for defecation; people use the bush.

Every man has a knowledge of house-building. Women do not actually build, but, along with the children, they pour water into the clay pit and carry clay to the men who are plastering the walls. Ngonga says, "People would be surprised to see a woman building a house. They would call her a he-woman." Men help one another in house-building by giving reciprocal service for which there is a gift of food and beer.

A deep rectangular clay pit is made as close to the house as possible, and the children thoroughly enjoy puddling the clay with their

feet. A trench about eighteen inches deep is dug for the poles (*akoso*), which form the framework. The wattle work is tied to the uprights with strong strips of red bark before the plastering is begun. The old type of Umbundu house was round, but most of the houses now show a transition to square or rectangular forms (Plate XLIV, Fig. 2).

Exterior wall-painting is found only in the northern districts of Angola (Plate LXXXIX, Fig. 2). Between Saurimo and Malange in the north, rectangular, painted houses are frequently seen. Wall-painting is a cultural trait from the Congo region where that form of decoration is common.

The method of forming a village site and the right of the chief to allot land have been described. The house of the chief is the first to be erected. There is drinking of beer to celebrate the completion of the village, and the pots of beer have to be stirred with the claws of chickens; these have been killed to provide blood for sprinkling the walls of the new houses. Village chiefs go through the process of stirring and drinking. The medicine-man drinks first, then he offers the cup to the chief.

The communal house is built by the united efforts of all men of the village. Ngonga says, "The king never helps with any of the building, but he talks very much." The guest house is also built by communal labor. The king of the *ombala* of Ngalangi told me that a king always uses the house of his predecessor, which must not be pulled down. No repairs are permitted and the house is used until it is absolutely untenable.

The interior of a commoner's house has three hearth stones in the middle of the floor, which is of hard mud beaten down with a heavy wooden implement called *ocikandulo*. The ceremonial placing of the stones has been described in discussing marriage. There is no chimney, consequently the walls and roof are blackened with smoke. The junction of roof and walls provides pockets for the reception of small articles. On the floor near the walls may be several large beer pots. The dark smoky interior is almost intolerable. The sleeping room is sometimes separated from the living room by matting. The bed is made from a cross-work of sticks supported on four Y-shaped posts, one at each corner. On the bed are coarse sleeping mats and possibly a modern blanket.

The miscellaneous contents of the hut are gourds, dippers, cooking pots of several sizes, pounders, and baskets. In many of the huts I found cooking going on in the general room, but frequently a sepa-

rate hut is provided as a kitchen. In some dark corner of the hut there is likely to be a sitting hen or a bitch with pups. Goats and pigs intrude from time to time. Lean dogs scavenge round the doorway. Naked little children whitened with dust play on the floor. A woman crouches over the cooking pot stirring the glutinous mass of corn meal. About sunset men are gathering in the council house to which their meals are sent.

They push forward the logs into the fire, throw their blankets around them and chatter until the women and children arrive with the evening meal. In the vicinity of the village, boys are wandering about with blunt wooden arrows fitted to their bowstrings, to be ready for the homeward flight of birds. Other boys are driving cattle to the kraal.

As darkness falls the long tubular drums are brought out. These are held between the legs and played in compound rhythm (Plate XXVII, Fig. 1). A shuffling dance begins, slowly at first, then with increasing vigor, to be continued far into the night.

## VII. EDUCATION

### INDUSTRIAL TRAINING AND DIVISION OF LABOR

Usually there is no formality connected with the industrial and occupational training of Ovimbundu children. The section dealing with play shows that boys and girls learn by spontaneous imitation of their elders.

There are, however, exceptions to this general truth. Special rites connected with the training and inauguration of blacksmiths and hunters have been described. The training of medicine-men and women will be dealt with in chapter IX, "Religion."

In describing economic life in chapter V, division of labor on a sex basis; also specialization in industry because of peculiar tastes and aptitudes, were noted. There is clearly a twofold division in industrial life. In the first place sex determines occupation, and within this primary grouping there is a secondary grouping depending on personal preference and individual ability. I have found no instance of exclusive hereditary right to any occupation or industry.

The net result of the Umbundu system of division of labor is indicated by the following summary:

When building houses, men dig the rectangular trench, cut the poles for the framework, lash the crosspieces, cut grass and lay the thatch, then place clay over the wattle walls. Women carry water for mixing the clay and convey the moist clay to the plasterers. Children puddle the clay with their feet. Males are hunters both professional and general. During a communal hunt women and children assist in driving game, which is frightened by the firing of grass. Boys organize games in which they imitate these activities. Men fish with a line and bait, whereas women use baskets and narcotic poison. Men and boys take care of cattle and have charge of dogs. Women and girls give what slight attention is afforded to other domestic animals. Male specialists castrate bulls and goats.

During agricultural operations men clear the ground and burn the bush. Women carry on hoe cultivation without assistance from men. Men are the chief carriers in caravans, but women and children may sometimes be seen carrying loads. They march in line with the men but have smaller burdens. Males are employed in blacksmith's work, wood-carving, making weapons and tools, weaving mats, dressing hides, spinning cotton, and formerly in weaving on an upright loom. Men are exclusively the makers of

musical instruments, and males are the musicians. Men are the only persons engaged in warfare and administration, and the *onjango* or council house is used exclusively by males. Men follow the occupation of medicine-man, in which there is considerable specialization. Female practitioners deal with pregnancy and women's ailments. In addition to the tasks for women mentioned above, the following are staple occupations: collecting firewood, drawing water, caring for infants, making pottery, weaving baskets, dancing, and singing. Young girls share these activities with older women.

The foregoing categories explain division on the grounds of sex. Degrees of specialization are not so easy to formulate, but in general a man follows some one occupation, for example wood-carving. Then within this occupation there is specialization in the making of drums, domestic utensils, or figurines.

Almost any woman could make pottery or baskets, but the difference in skill leads naturally to concentration in the hands of expert potters and basket-weavers respectively. These sell their wares to those who either do not make such articles or are inept at the process.

#### STANDARDS OF CONDUCT, MANNERS, AND SALUTATIONS

The parents of a child, also his maternal uncle, assume responsibility for training in the precepts and standards given here. The maternal uncle, who is the mother's oldest brother, is particularly interested because he has to pay fines should his sister's children commit thefts. The evidence indicates that the home and restricted family have formative influences over the conduct of children.

Children are beaten if they tell lies, answer old people rudely, or steal food. Ngonga says that his "stealing hand" was once placed in the hot leaves of the cooking pot. If a child steals an egg which is cooking, the hot egg is held between the culprit's hands.

One cannot fail to notice the quiet and unobtrusive way in which children sit in the presence of their elders both in the home and in the council house. Children do not speak when their elders are in conversation, unless addressed.

A child, likewise an adult, receives a gift with both hands. The implied idea is that reception with one hand is a depreciation of the gift. If a child holds out one hand, the hand is slapped. When receiving, an Ocimbundu says "*kuku*," literally grandfather or elder. Colloquially the word is used to mean greeting, "I thank you," or "I beg your pardon."

Lying is strongly disapproved and the liar is called *ohembi*. The Ovimbundu appreciate hospitality (*unu*) which also means generosity. A man who is hospitable is said to be *ongavi*. Greediness, which is disliked, is described by the word *oku sapa* ("to be greedy"). There are standards of honesty in sales and exchanges. A deceiver in trade is *ohembi*.

With regard to the relation of the sexes in early years it may be said that, in spite of boy and girl friendships, and the communal sleeping of boys and girls at the home of one of the girls, a man expects to marry a virgin, a point which has been dealt with in describing marriage ceremonies.

Naturally there is a difficulty in obtaining precise information respecting the details of these nocturnal gatherings of boys and girls. Ngonga said that girls inform their parents concerning the house where the night is to be spent, and there is a point of etiquette requiring that girls must not go to a house where boys are staying together.

Standards of conduct already described under courtship are a result of direct teaching by parents. Marriage rules and a classificatory system of relationships, with its prohibitive decrees, are taught in the home, in the men's council house, and at initiation ceremonies where such exist. In addition to these sources of instruction there is no doubt an unconscious absorption of ideas and standards. The power of suggestion is always at work through everyday examples.

Apart from demands made by tribal custom and direct instruction there are variable personal standards of modesty. Ngonga states that many lascivious stories are told among men, and when the men are drunk, they tell these to women. "Sometimes the women laugh, but the good women do not like to hear these tales."

A male commoner when meeting the king bows low, extends his arms, claps his palms and says, "*ohosi* ['lion'] *akuku* ['grandfather']". Only the old people follow the ancient custom of falling on their knees when greeting the king. The Ovimbundu never were in the habit of doing more profound obeisance, but the Vangangella, when greeting one of their kings, rub their chins on the ground and place dust on their chests. Even at the present day a woman or child of the Ovimbundu is expected to kneel when greeting a king, but such an acknowledgment is not now usual in greetings given by a male commoner. The reply of the king to the commoner is "*kalunga*." This word enters into greetings of all kinds. The literal meaning of the word is "the sea," "king," "god," or "death," but the interpretation

of the word depends upon the syllable accented and the context, as further explained in the chapter on the Umbundu language.

A man or woman of the royal family greets the king with the words *na kuku*; *na* means "lord," and *kuku* is a term used for any old man to whom the speaker intends to show respect. *Kuku* is also applied to a man who stands in the relationship of grandfather. The king is expected to reply to a greeting given by one of the royal family by placing his right hand on his chest and saying twice, "*kalunga*." There may then follow from the king a question relating to welfare in general. Possibly the king will inquire the object of his subject's journey. A *sekulu* ("chief of a village") greets a king in the same manner as does a commoner, and the king replies as he would to a commoner.

Commoners greet a *sekulu* with the words *na kalunga* ("lord, greeting"). One *sekulu* greets another of the same rank with the one word *kalunga*, accompanied by clapping of the palms. Male commoners clap hands on meeting; this action is accompanied by the word *kalunga*, from each of them. Two female commoners use the word *kalunga* as a greeting, but as a rule they do not clap hands. They do, however, clap their palms when greeting a woman of the royal house.

Boys and girls must greet their fathers, maternal uncles, grandfathers, and other old men with either of the terms *na kuku* or *na kalunga*, the latter being more usual. *Na kuku* would be the appropriate term of respect for any elderly man. Children use the same words (*na kuku*) when addressing any elderly woman, including a grandmother. A usual greeting of a child to the mother, likewise to the mother's sister, would be *kalunga mai* ("greetings, mother").

There is no prescribed form of address to the medicine-man. Greetings between a commoner and a medicine-man follow the usage noted for two commoners. Ngonga says, "They will treat him (the medicine-man) like a village chief if he is an old man and good. Perhaps they will say *na kalunga* as if talking to a chief."

In the early morning people pass the greeting *oku lipasula*. This means "we have been like dead, we are awake." The appropriate early morning greeting of a commoner to the king or to a chief is *oku lipasula a kuku*. A usual afternoon greeting is *oku lañisa*. The evening greeting is *oku lisuñinya*.

One who desires to pass across a room usually walks in front of other people, but while passing the attitude must not be erect. The thumb and middle finger should be snapped together, while the words

*konyimo oko* are spoken. The literal interpretation of these words is "back there." Ngonga says the words actually mean "excuse my back."

Spitting in the vicinity of the house of the king or of the chief is not allowed. "If you did that in the old days, you would have to pay something." Some people spit near the hearth in their own houses. A man who spits in the road is expected to cover the spittle. No person would spit in the presence of the chief or of the king. A hand should be placed in front of the mouth by a person who is coughing or sneezing.

Shortly after the birth of a boy or girl all who are on good terms with the parents greet them by saying *kalunga*. The word is repeated four times with clapping of the palms. When words have been imperfectly heard and the listener desires repetition it is customary to say *kuku* in an interrogative tone.

No particular etiquette is observed when eating. Two or three children eat from one platter, helping themselves with their fingers to the mush or sweet potatoes.

Rules forbidding the preparation of food by menstruating women, likewise prohibitions relating to stepping over a person, are mentioned in discussing taboos and omens.

#### EDUCATIONAL VALUE OF PLAY, MUSIC, AND DANCING

The educational value of play lies in its imitation of the pursuits of adult life. Though there are specialists in music, dancing, and singing, these exercises are indulged in by everyone. Music, singing, and dancing are more than amusements, they are fundamental as coordinating forces in tribal life at all levels of culture (W. D. Hamblly, *Tribal Dancing and Social Development*, London, 1926).

Among the Ovimbundu *Cimbamba Co Lia* is a popular game for girls, who form a circle, join hands, and sing:

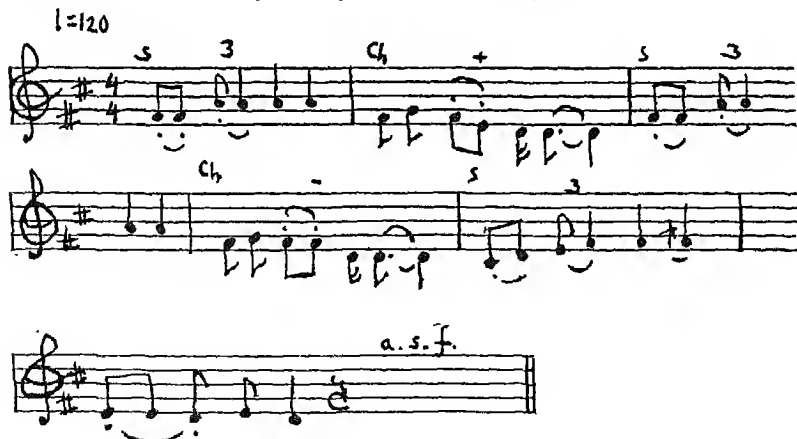

#### PART I

*Omola una, ndo sile vekango, Cimbamba co lia* ("That little child was left in the desert, the nighthawk ate it"). At the word *Cimbamba* they begin to dance, facing from side to side in such a manner that they meet and bow. Some sing, *Cimbamba co lia* ("The nighthawk ate him"), and others respond, *Kalikisi* ("tis the goblins"), as many times as they wish. Finally a return is made to the first words which are sung again. All musical transcriptions have been made by Dr. G. Herzog from my phonographic records.

## PART II

The children then form in a line holding each other. The leader is the mother and all the others are her children, except one who is the leopard. The last child in the line calls, *A mai, ongue yi ndia* ("Mother, the leopard will eat me"). Mother, *Ka yi ku li*, ("It will not eat you"). Child, *Yi lia utapi wovava* ("It is eating the water carrier"). Mother, *Ka yi ku li*. Child, *Yi lia utiañi wolohui*. Mother, *Ka yi ku li*. The one who represents the leopard now attempts to pass the outstretched arms of the mother in order to catch the child. Every time the leopard is foiled in his attempt to catch the child they all cry, *Ah-ah-ah Ka yi ku li*.

Eventually the leopard gets the last child and deposits it on the ground where it immediately begins to imitate the pounding of meal and to sing, *Fule, fule, fule, fule, kolohanda ko Larwa* ("Pound, pound, pound, pound on the rocks of Luwa"). This ditty, which is sung by women during their daily occupation of pounding maize on the

rocks, is repeated until all the children have been captured. Lastly, the mother is caught and taken by the leopard to the bushes, where he hides her.

The leopard goes back and picks up a handful of sand which is an imitation of meal. Each of the children pretends to pick up a handful of sand before going in search of the mother. The leopard

says, "Here's your mother." The children look and sing, "She's not there." They throw sand in that direction. The leopard repeatedly leads to places where the mother is not hidden, while each time the same words are repeated and sand is thrown. Finally the leopard leads the children to the place where the mother is hidden. Then the mourning song is changed to a glad dance. The children clap hands and sing, *Mai Cisangu weya. Mai Cisangu weya* ("Mother Cisangu has come").

After transcribing the music of this song Dr. Herzog reported, "The melodies are rather simple, moving within a restricted range, with a plain rhythm, the same short unassuming melodic fragment being repeated as long as the game may require it, or changed slightly to suit the words. It should be kept in mind that these are children's songs; other songs of the Ovimbundu are probably much more elaborate. The manner of singing songs by a solo and a responding choir is highly characteristic of African singing. Thirds as seen in the transcriptions on page 218 are often used in the music of west Africa.

"In the musical notations, *S* stands for Solo, *Ch* for the Choir. A as a sign above a note indicates that the tone is sung approximately a quartertone higher than noted. It indicates a short transitional tone of slight rhythmic or melodic significance and of uncertain pitch."

There is but one example of children's dolls in Field Museum's collection. This was obtained from a little Ocimbundu girl of Elende. The doll is made from a corncob which is draped in blue cloth of European origin such as women wear. My interpreter said that the dressing of dolls made from corncobs is a general custom at the time of cutting the corn. In view of the frequent occurrence of agricultural rites among Bantu Negroes, the use of dolls led me to inquire into the possibility of there being some kind of fertility cult associated with a corn-mother concept, but my inquiries met with negative results.

There is an Umbundu word for game (*omapalo*; plural, *olomapalo*) which is used for games in general. The verb *oku papala* means "to play." As a rule, male adults do not play games, but they have the game of mancala which is called *ocela*. This is difficult because it involves quick counting. Mancala has a wide distribution as shown by the fact that it occurs in Africa, Syria, the Malay Archipelago, South America, and the West Indies. At Dom Manuel in the southeast of Angola I saw an arrangement of holes in the ground which was used for this game. There were four rows of fourteen holes in each row. The counters were nuts from an oil palm.

In the compound of the king at Ngalangi there was an *ocela* board consisting of an oval piece of wood on a short base. This board had holes arranged in four rows of seven, twenty-eight holes in all. The king refused to sell the board. He said that it was highly valued and that the gambling stakes were high.

Up to the age of sixteen years boys play the game of *ociliña*. Each side has a number of bulbs from a figwort, which are rolled along between two lines of boys who shoot at them with arrows. The winners are those who have shot the greater number of their opponents' bulbs. The party A rolls bulbs while the opponents B do the shooting. Then the positions are reversed. A game with whipping tops is *ongilili* which is said to be of Umbundu origin, not a derivative from a Portuguese game. There is no evidence that games are seasonal; any game may be played at any time.

Games of mimicry naturally form a diversion, and boys imitate the occupations of their elders. The chief activities of adult males are warfare, hunting, and carrying, all of which used to play a very important part in the communal life up to a few years ago. When boys play at making war they have two sides, the attack and the defense. The attacking party runs about the village taking prisoners, who are tied with bark rope. Girls sometimes play this and other games with the boys, but usually boys and girls play separately.

Sometimes strong boys are selected for hunters whose dogs are the little boys. Boys who pretend to be the antelopes or other game go to the tall grass to hide. Toy bows and arrows are made, but sometimes the hunters go through only the movements of shooting. The boys who are pretending to be the game roll over and gasp when shot. The "dead game" has to cling to the pole on which it is borne to the village on the shoulders of the hunters. The little boys go along on all fours barking like dogs.

The Ovimbundu were, and still are, renowned carriers whose prowess is imitated in boys' games. Boys make up loads in the correct way; that is, lashed in the fork of two long sticks which can be rested on the ground. These they carry along, singing as they go. There is some wrestling, also stone throwing to test distance and accuracy. Rubber is made into a ball which is bounced rapidly and repeatedly with the open palm. Men and boys sometimes form a ring around which the ball is thrown from one person to another.

The Ovimbundu have no game played with string wound around the fingers, and I have been unable to find any evidence for the past or present formation of string figures. I have seen boys making bird

cages and wooden animals to use as playthings. Girls mold small animals from clay. The bull-roarer is in use as a plaything at Elende.

There is a game of hide and seek for boys. A knife is hidden; then a boy who has been absent for a time enters the ring marked off for the game. His proximity to the knife is indicated by playing on a musical bow. There are taps on the instrument which mean that the knife is far away. On the contrary, when the searcher approaches the hidden knife, the boy with the bow plays a distinctive note, *yehula, yehula*, meaning "pick it up, pick it up."

Boys readily make a simple apparatus for playing a game of lassoing a hoop. A pliable branch is bent so as to form a circle, then the ends are lashed together with bark strips. The lasso is a piece of rattan or bark having at each end a corncob or a small stick three inches long. One boy bowls the hoop so that it passes in front of, and a few feet away from his opponent, who stands twenty-five feet distant. As the hoop passes in front of him, the boy throws his lasso in such a way that it twines round the hoop and brings it to the ground.

There are dances of many kinds, but Ngonga says that he would not know from the steps only what particular purpose the dance served. Several dances have been described, each in its appropriate section. There are no dances specially arranged to celebrate weddings or births. The funeral dance is described along with other ceremonies relating to interment. The medicine-man dances in connection with making rain or curing the sick. In order to say why the dance was being performed, it would be necessary to listen to the words of the songs; these are usually chanted in accompaniment to shuffling movements and the rhythm of drums.

Some of the older men and women perform dances and sing songs that are unknown to the younger generation. Dancing is in favor during the months of May and June because there are supplies of maize for making beer. As the dry season advances the maize formerly available for making beer is consumed as food, hence dancing is not so usual. Ngonga says that the old people know a dance which should be performed at new moon "so that there will be no sickness during this moon." Older men dance in commemoration of events during past wars, while women are spectators, and on these occasions there are beer-drinking and the slaughter of an ox. A group of men keeps up a shuffling dance while an old man relates a war story in a singsong voice. The oldest man is the first to cut the meat, after which each man helps himself.

Almost every evening one may hear the tapping of drums and the songs of dancers, because in addition to dances for a funeral or other special occasion there are ordinary dances of amusement in which lines of men and women advance and retreat, or men and women circle round the drums making arm movements accompanied by a swaying rhythm.

The dance *onyaco*, performed in June when the corn is ripe, may have an ancient history and special significance as part of an agricultural rite. When corn is being stored the people sing, "There is grain in the house, may it never be out." There is no dance in connection with fishing.

There is mimicry of animals in the hunting game played by boys. The frog, the leopard, and other animals are imitated in certain games, but I have no evidence of the performance of mimetic dances in relation to any cult for increasing the supply of animal life.

The use of the small ball *ombunje* illustrates the way in which an apparent toy can be used in rites of a religious kind. *Ombunje* consists of a hard spherical fruit about six centimeters in diameter, in which several hard seeds rattle. The sphere is covered with a layer of cloth over which lizard skin is stretched and sewn.

When the people wish to commemorate the death of a king, or when the king is sick, the medicine-man (*ocimbanda*) says that there must be *osaka* dancing. A strong man dances for many hours while holding this little ball in his outstretched hand. Other men who are dancing use their fists to hit the muscles of the outstretched arm in an attempt to make the holder drop the ball (*ombunje*). If he does so another man will promptly take hold of it. The precise nature of the endurance test is unexplained, but there is possibly the idea of giving strength to a sick king by this tension and endurance. My interpreter thought this was so, but could not explain why the dance should be performed to commemorate the death of a king. It would seem natural, however, to transfer the *ombunje* rite to a commemorative festival, if in the first place it was part of the last rites of a dying king.

There are among the Ovimbundu specialists in dancing, singing, and the playing of musical instruments. *Onjimbi* is the word for a singer of merit who starts the choruses. *Ocili* is a dancer of more than ordinary skill. When a man is required to play a drum or other instrument I have noticed that it is thought necessary to bring a specialist. There is no doubt that drumming requires special aptitude and practice. The man who plays the long drum is *usiki*, the drum

itself is *onoma*. The flat wooden drum without membrane is *ocingufu*, the player of this drum is *usiki wocingufu* (Plate XXVII, Fig. 2). The long tubular drums vary in length from 50 to 103 cm. At a funeral, four of these tubular drums, which are usually held between the legs or placed upright, are played in compound rhythm. A performer always warms the skin of the drum at a fire, and sometimes the pitch is altered by sticking a lump of wax on the membrane of a long drum, or on the sides of a wooden drum.

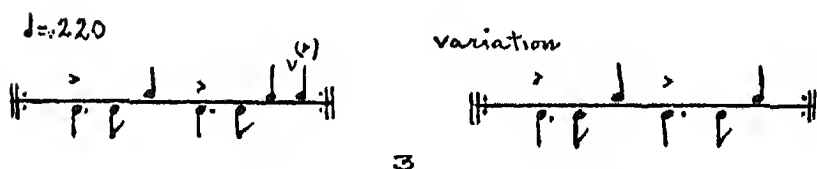

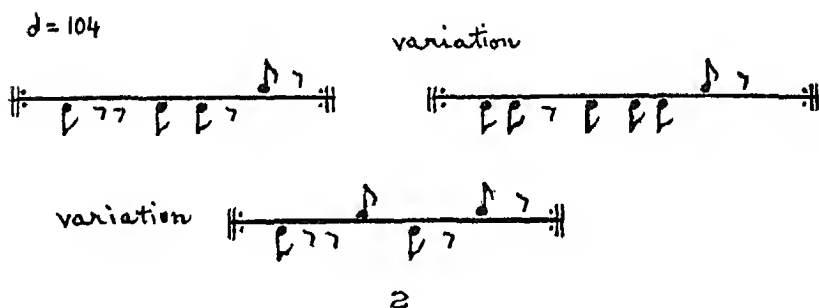

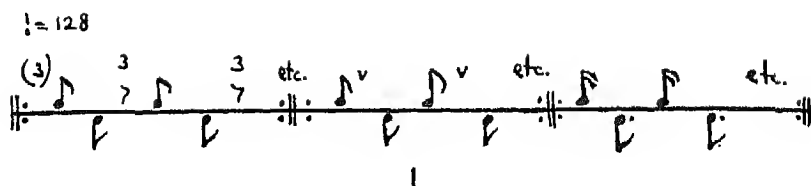

Dr. Herzog reports as follows, after transcribing several cylinders of phonographic records of rhythms played on the long drum, and after examining motion pictures which were synchronized with the drumming (Plates XXV, XXVI).

"These motion pictures indicate the position of the performer's hands, and suggest that the sharply accented tones are produced by impacts from the phalanges. The higher notes so produced have been marked by notes above the line. A mark placed between notes indicates a very short rest.

"No. 1 (dictaphone record 3) represents the drumming of a young player, who is apparently still an apprentice, since his rhythm is very simple. The three forms of his playing given below were used interchangeably, and he shifted from one to the other without stopping. In the second form, the order of the sharp and of the plain beat is reversed. Otherwise, the sharp beat occurs, in the playing of all drummers, on the off beat. The rhythm of No. 2 (dictaphone record 15) is a little more varied because the player was changed. The drummer of No. 3 (dictaphone record 30) was the best performer in the neighborhood, according to Mr. Hambly; and his playing is the most interesting. The drum records consist of a small number of rhythms which are freely interchanged; the two predominating rhythms are given below. The moving pictures were made from this player's performance.

"The notations found here do not convey to the reader the bewildering complexity of African rhythm, for this appears only when a performance includes the use of several drums and musical instruments in conjunction with dancing."

From Ngalangi a large friction drum 120 cm long and 47 cm in diameter was obtained. This instrument, which was the property of the village, was played only on public occasions. Apparently the drum had been hollowed from a log of wood, one end of which was left open while the other was covered with hide. To the inner side of this hide a long cane was attached. On the side of the drum

and in the middle was an oval aperture. The performer laid the drum on the ground and took his seat astride it. He dipped his right hand in a gourd of water, then rubbed his wet palm up and down the cane rod, which he could reach through the oval aperture. The sound of the rubbing on the rod was communicated to the membrane.

A short friction drum made at Elende measures 21 by 42 cm. One end of the drum is covered with hide kept taut by pegs of wood while the other end is open for the insertion of the player's hand. A cane rod is attached to the inside of the membrane. The assistant of a medicine-man holds this instrument under his arm and plays during divination. The medicine-man sits on a stool shaking his divination basket (Plate XXIII, Fig. 2).

Rattles are of three kinds, and of these the more common are a small, long-necked gourd containing hard seeds, and a compound

rattle made by fixing seed pods on a stick. Rattles of the latter type are sometimes tied to the ankles during dancing and they usually form a part of the medicine-man's outfit (Plate XXII, Fig. 4). From Cangamba a basket rattle of dumb-bell form was obtained; the basket-work receptacles at each end of the connecting rod contain hard seeds (Plate XXII, Fig. 1).

At Bailundu three Ovimbundu flute players met a party of visitors whom they accompanied around the native village under the leadership of a chief. The men played the flutes continuously except when the chief was speaking. The wooden flutes varied in length from 20 to 50 cm. The instruments were end-played, and the smallest of them had seven stop-holes. The visitors were conducted from the village by this small orchestra which is a permanent guard of honor for the chief (Plate XL, Fig. 1).

At Cangamba the Vachokue have an instrument consisting of eight slats of wood which vary in length and thickness. These sounding boards are attached to two parallel cords which are kept tight by two assistants. The performer taps the wooden slats with two sticks terminating in balls of wax. This is the well-known marimba, but the gourds which are usually fastened under the slats of wood were absent in this instance.

The instrument *ocisanji* is played well by only a few men. It consists of a wooden board, often well carved, on which there are from eight to nineteen thin keys of metal. These can be pushed backward and forward in their bridge so as to alter the vibrating length and pitch of the note. The pitch may also be varied by placing small balls of wax on the under side of the keys. When the instrument is held between the palms the player's thumbs are in position for stroking the keys. Sometimes *ocisanji* is played inside a wide gourd (Plate XXII, Fig. 5).

The musical bow is called *ombumbumba*. The bridge, which is a small stone, or a piece of wood placed at one end of the bow, keeps the string taut. The gourd is tightly fastened to the bowstring with a loop of string. One end of the bow is sometimes placed in the player's mouth. The left hand holds the bow and presses the gourd to the body, then releases it a little from time to time in order to assist tone and resonance. The player holds in his right hand a reed which is tapped lightly on the bowstring, while the thumb and forefinger of the left hand are used occasionally in pressing on the string to alter its vibrating length (Plate XXII, Fig. 6).

Another musical bow named *ekolowa* is of simple construction, consisting of a strip of cane from 54 to 70 cm long and 2 cm wide. At each end of the cane is a projection. A string, when tightly stretched between these projections, pulls the cane into the form of a bow. The performer, placing one end of the bow in his mouth, plucks the string with his thumb and forefinger (Plate XXII, Fig. 7).

Two rubbing instruments are used by the Ovimbundu. *Ogolanda* is a large gourd with a slit in the top along which there is a board cut into sixteen notches. The rubbing of a short stick along these notches produces a sound which is greatly amplified by the gourd resonator. The second instrument of this type is in the form of a wooden bow having its thickest part notched for rubbing with a stick (Plate XXII, Figs. 3, 8).

Only specialists are skilled in composing songs, and both men and women are composers. The younger people sometimes go to the old people to learn songs which were popular a generation ago. There are no professional itinerant story-tellers.

There is a chant for funerals which has been quoted in the appropriate section, but no special wedding songs are used. The Ovimbundu have satirical songs humorously describing individual foibles and peculiarities, and as usual in Negro communities a satirical song is feared by thieves, adulterers, or other offenders.

In former days when men were on the warpath they sang, *Okaimbo ketu katito eteke tu lisanumbula tu tandako*. ("Our village is little today, we attack, we extend.") Another war song is *Ocisonde ci likoka ove o kasi vonjila tumdamo*. ("Red ant that creeps along, you who are in the way, get out.")

When men on the march came to a camping ground occupied by another caravan, they sang as a challenge, *Cinene nye? Cinene onjamba kakuli okachama kavela ukuavo*. ("What is the largest? There is no animal largest. The largest is the elephant.")

During hauling and carrying, men sing, *Yende, yende chale, ocimboto lomala vaco*. ("Let it go, let it go, the crab, the frog, with its children.")

Lifting loads is always accompanied by noises which suggest that someone is injured. Part of the men make deep grunts to which their companions answer with prolonged groans.

#### INITIATION

Evidence bearing on initiatory rites in Angola shows that the ceremonies are arranged as a process of incorporation into the

tribes, for everywhere these rites aim at securing ideas of unity, cooperation, conformity to tribal law, and admission to adult tribal life.

The methods used to achieve these aims are seclusion, circumcision, physical suffering, direct tuition, dancing, hunting, a change of name, and finally a ceremonial return to the tribe with adult status and the right to marry.

The following notes give details of ceremonies witnessed at three centers; namely, Katoko, Ngalangi, and Cangamba. For comparison of these rites with others performed in eastern Angola reference should be made to the books of A. Schachtzabel, and to the papers of H. Baumann (III), and F. and W. Jaspert, whose observations were made independently of each other and of my own investigation.

The dances of the novices at Katoko, where there is a mixed population of Ovimbundu, Vangangella, and Vachokue tribes, are part of the final ceremonies following circumcision and seclusion. The social group formed by this collective circumcision, seclusion, and dancing, is called *ovinganji*, which is the name of the initiatory rites themselves. A boy who has been initiated is not allowed to become friendly with one who has not suffered the ceremony, and all boys who were circumcised at the same time preserve a sense of unity by dancing in a company and moving about together for twelve weeks after their return to the village from which they came.

Circumcision, which is prohibited by the Portuguese government, is still practised secretly in some regions. When circumcision is carried out by primitive methods serious infection may result from the lack of clean instruments, for the knife is, of course, unsterilized.

After the operation the patients are subjected to harsh treatment during the period of cure that follows. The circumcised are secluded in a wooded area. Food provided by the parents is placed on the bank of a river near which the initiation camp is built, and after the parents have gone away the boys bring their rations from the river to the camp. Before eating, the boys are obliged to give profuse thanks to the men who are acting as tutors. In some regions there is no food ration for the boys, and the rule is that each boy must subsist on what he is able to catch and collect with his hands.

Each boy has a male guardian who takes care of him after the operation. Those who have been operated upon are not permitted to wear clothes, nor are they allowed to warm themselves until quite healed. Any infraction of the rules results in a severe whipping.

During the period of isolation costumes for the dance are made. These consist of clothing of tightly fitting, coarse netting, masks, and girdles which are for the use of only those boys who have been circumcised. The feasts and dances celebrating the conclusion of initiatory rites are of great importance. Women are not supposed to know that the operation of circumcision is taking place, and they are taught that *ovinganji* are supernatural beings who have sprung up from the earth; therefore every effort is made to conceal masks and costumes from the sight of women and the uninitiated. No female is allowed to go near the enclosure where novices are confined.

A few days after observing the costumes and dances of the newly initiated boys at Katoko I was in the Ngalangi region at the village of Ngongo, about a hundred miles to the north of Katoko. At Ngalangi two boys of the Ovimbundu were questioned with regard to their experiences in the initiation camp.

It is certain that initiation ceremonies are held at irregular intervals and not more frequently than once in four years. The name given to the ceremonies for boys in the Ngalangi area is *ocinganji* (*oci*, "big"; *nganji*, "judge," or a masked person). When there is a number of boys who have not been circumcised, these approach the oldest men to ask for a circumcision ceremony. The old men visit the *sekulu* ("headman") of the village to request that arrangements shall be made. An *ocimbanda* ("medicine-man"), assisted by other men, prepares a camp in a wooded area. Usually the father of each boy has to arrange that a tutor shall accompany his son to the camp, but sometimes as many as three boys have the same guardian. The guardian receives a small fee, possibly nothing more valuable than a chicken.

The camp is made on the side of a stream remote from the village. Each boy takes a chicken to the camp for the purpose of making a special meal, which is given at the name-changing ceremony which follows initiation. The chicken is eaten soon after the boy has been circumcised. The boy changes his own name for a new one which is announced in the village from which he came. While circumcision is in progress the enclosure is surrounded by male drummers and men who shout, so that any noise made by the boys during circumcision will not be heard.

The period spent in camp is uncertain, probably from three to six months. The rule is that camp is not disbanded until every boy is healed; which means that the confinement may be greatly

prolonged if even one boy fails to recover. One of the two youths interrogated said that in his camp there were seventy-eight boys, three of whom died. My other informant said that in his camp there were sixty-eight boys, only one of whom died. The informants agreed that the deaths were due to an epidemic of influenza and not to privations or septic conditions arising from the operation.

During the period of seclusion the boys are taught songs and dances used at the ceremony that celebrates the conclusion of their initiation. By privation the boys are taught the value of food and fire. Novices are beaten if they show any disrespect for their guardians, and trifling offences are severely punished. Every boy has to take from the fire a burning stick, which he holds in his hand while running between two lines of men who beat him, and if he drops the stick he has to start his run once more. The boys swear allegiance to one another. A novice thinks that he will die if he gives information to a woman or to a man who has not been initiated.

From his mother, each boy receives food in a gourd which he deposits on the bank of a river near the novices' camp. If a boy dies, a hole is bored in the gourd so that when the mother receives this she will not send more food. Each guardian has a stick which is sent to the mother of his pupil when the ceremony of initiation and seclusion is ended. If the boy has died, bark is cut from both ends of the stick before this symbol of death is sent to his parents.

When the boys come out from their camp at the conclusion of the rites one man and one woman stand on the bank of the river, and the boys pass under the legs of both the man and the woman. When the boys arrive at the village the whole population comes out to welcome them. There is a feast and beer-drinking bout on the day of return.

During seclusion no water is allowed for washing, and the informants laughed as they spoke of the order "wash hands," whereupon the boys merely rubbed their hands together. When the order, "wash dishes," was given the boys rubbed their platters with their hands. On the day of leaving camp the novices bathe in the river. Ablution consists of three dips, after each of which the boy stands on the bank until he is dry.

For two months the boys wear strips of bark cloth. During this period all the novices must move together, but there is no objection to their leaving the village provided they do so all in one company. While wearing bark cloth the boys have each day to attend a cere-

mony at which the older initiates dance while the novices clap their hands.

I witnessed the dance of initiated boys at Ngongo, where the costumes resembled those I had seen at Katoko. At night a youth brought for me a set of initiation costumes (Plate LXXVIII, Fig. 1), which resembled those worn during the dance; this he did with great secrecy.

While at Ngalangi, the initiation of girls was investigated. After several days of negotiation with a village headman three female guardians of the girls came from the bush. The illustrations (Plate LXXVII, Figs. 1, 2) show the attitudes of these women and their decoration. There were three male drummers in the orchestra and several women, who sang and clapped their hands. On emerging from the bush the females moved toward the orchestra with their backs toward the players. As there were about two hundred yards to cover, this slow backward movement occupied a long time, since the three women did not take more than a few inches at each step. The dance itself was a slow, shuffling, swaying movement, made while the bodies of the performers remained inclined forward and their heads were bent so that it was almost impossible to see their faces. The women wore no clothing except loin cloths. Each female was plastered from head to foot with alternate bands of red and white clay smeared thickly. These three females are the women who act as instructors for the girls during isolation in the bush where they receive sexual and domestic instruction.

The seclusion of girls covers a period of one month. During this time the novices suffer no harsh treatment though an operation is performed, possibly excision of the clitoris, but I am not certain on this point. It was also stated that a corn-cob is introduced into the vagina. The tribe practising this ceremony for girls was the Vanyemba, living close to the Ovimbundu at Ngongo near Ngalangi in central Angola.

In order to corroborate further the two accounts of initiation ceremonies for boys I journeyed to Cangamba in Moxico, eastern Angola. The position of the two first centers visited (Katoko and Ngongo) is on the border line where Ovimbundu and Vachokue mingle, and although there is a mixture of these and other tribes at Cangamba, the culture, language, and physique of the Vachokue predominate. A description of the circumcision ceremonies witnessed at Cangamba is given below for comparison with the accounts resulting from visits to Katoko and Ngongo.

The compound in which the initiates had been confined for three months was a circular enclosure made of light branches and leafy boughs, at the narrow embrasure of which stood a guardian of the boys, who permitted entrance. In the middle of the large enclosure were seven small cages, each of which was just large enough to allow one boy to lie on his back, and I was informed that the boys lie thus for two weeks after circumcision (Plate LXXX, Fig. 2).

The ages of the boys appeared to be from ten to seventeen years (Plate LXXX, Fig. 1), an observation which agrees well with that made at Katoko and Ngongo. The disparity of age among the novices at each center where initiation was observed bears out the statement that initiation ceremonies are held at irregular intervals, but not more frequently than once in four years.

During confinement in the large enclosure the novices had made masks and costumes (Plate LXXIX, Fig. 1), and when they were pulling on the coarse netting suits, which fit tightly, I observed that circumcision had been performed thoroughly, evidently some weeks ago, for the wounds were healed. Masks were obtained, and these the instructors of the boys were careful to wrap in bark cloth, at the same time requesting me not to show the objects to women.

A few days later these boys returned to their village to dance while wearing the costumes which had been made in the enclosure. At Cangamba the final ceremony lasted twelve hours amid great excitement, including ceaseless drumming and dancing. One boy, who wore a skirt on his fiber costume, lifted this to display an artificial penis of great size (Plate LXXIX, Fig. 2). This organ he grasped in his hand while chasing the women and girls, who ran away screaming and laughing.

At this ceremony there appeared stilt-walkers (Plate LXXXI, Fig. 1) and a medicine-man, a member of the Luchazi tribe (Plate LXXXI, Fig. 2).

Circumcision among the Bdjok (Vachokue) has been witnessed by C. P. Holdredge and described by Kimball Young (*Amer. Anthr.*, XXIX, pp. 661-669). This ceremony took place in the far north-east of Angola. The man described as the *magish* of whom women are afraid, but who is known to the initiates, corresponds to the Uluchazi medicine-man seen in the final ceremony at Cangamba. Of this grotesquely dressed person the men and boys took no notice, neither did he pay attention to them. On the contrary he chased women, who ran away screaming. Kimball Young's description of the enclosure where boys are confined, and his account of the

short fiber skirts worn within this enclosure by the novices, are in agreement with the observations made at Cangamba. There is also a close resemblance between the independent accounts of H. Baumann and F. and W. Jaspert for the Vachokue, also P. A. Delille and E. de Jonghe for the southwest Congo.

The question of initiation rites, past and present, among people of pure Umbundu culture is important. The matter is more fully *dealt with later in discussing cultural contacts and cultural losses*, but there are a few points which should not be omitted here.

At Caconda, an Umbundu center of western Angola, Père R. P. Laegel stated that only two years ago he had visited an initiation camp of Ovimbundu boys in the hope of persuading them to return to his mission school at Caconda. My informant stated that the boys were circumcised, beaten, and confined to an enclosure for several weeks. Those who cried out when flogged received a double portion of blows. Poisoning is the fate of a boy who reveals the secrets of the initiation camp to women or uninitiated boys. This is the most direct testimony I have received concerning initiation rites among unmixed Ovimbundu.

From Bailundu and Elende I have obtained slight evidence of initiation rites. At the former place, which, like Elende, is a center of the Ovimbundu tribe, fiber costumes were obtained. The mask from Elende is unlike those used at Cangamba, Katoko, and Ngongo. The fiber suits are, however, no different from costumes used at these places. Initiation ceremonies are not held at Elende today, and beyond Dr. Ennis's statement that circumcision rites have been revived in the past fifteen years of his long residence in the neighborhood of Elende, I have no evidence of ritual.

The data relating to initiation of boys in Angola suggest loss of the initiatory rites from Umbundu culture, until only a few old masks and costumes, along with attenuated ritual, remain sporadically. On the contrary, in eastern Angola and particularly among the Vachokue, who are farther than the Ovimbundu from coastal influence, initiation ceremonies flourish. At present there is occurring a penetration of initiation rites from the Vachokue area into east-central Angola, which is a region of cultural admixture.

The foregoing pages have described certain institutions and social forces which collectively bring individuals into conformity with tribal standards of conduct. The influences at work in this direction may be direct or indirect.

Among direct educational forces are the home training given by parents and the mutual responsibility of children and their mother's brother, whose reciprocal obligations have been explained. Family life is undeniably an important institution whose power is by no means suppressed by the strength of the village community and tribal organization.

Initiation, which may or may not coincide with puberty, is perhaps the most potent direct influence in formation of character and the inculcation of principles tending to tribal solidarity. Formerly warfare and hunting were more important than they are today, consequently initiation rites imposing hardship and emphasizing the importance of concerted action, had a greater social value than they have at present.

Formal instruction in industries such as iron-working, or professional hunting, indicates one aspect of occupational training. In these instances there are apprenticeship and an initiatory rite. All children are, however, subject to an indirect industrial education through the agency of play, while a few, according to desire and aptitude, become experts in some particular occupation.

At all times the force of suggestion is at work in the home, in the men's council house, and through everyday observation of the conduct of elders. Probably folklore stories also have an indirect educational value, because some of the fables show the desirability of courage, honesty, and foresight, at the same time deprecating cowardice, stupidity, and low cunning.

In chapter IX religious beliefs are discussed, and, in connection with these, standards of conduct are outlined. Although the Ovimbundu have a belief in a supreme being and creator (Suku), and although they believe in survival after death, there is no evidence to show that conduct and education are influenced by theological beliefs. Suku, who is vaguely conceived, is far away and uninterested. He issues no commands. Neither is there a belief in punishments and rewards after death. The standards of conduct are based on utilitarian principles which secure harmony and unity.

The efficiency of the direct and indirect educational forces of the Ovimbundu is attested by the history of the tribe. The indigenous system of education, supported by favorable environment, consolidated these people so that they became the dominating power in Angola. Moreover, their cohesion has been such that three centuries of European contacts have failed to eliminate all the basic elements of their tribal life.

## VIII. LANGUAGE

### AFFINITIES OF UMBUNDU

The Umbundu language is widely understood in Angola owing to the journeys of the Ovimbundu as raiders and traders in large caravans. Umbundu is as important for communication in Angola as Hausa is for Nigeria, or Swahili for the east coast of Africa.

Notwithstanding this use of Umbundu as a *lingua franca* it is necessary to note that tribes surrounding the Ovimbundu have their own distinctive Bantu languages; moreover, the Umbundu language itself has several dialects.

For example, the Vasele tribe living in rugged country in the hinterland of Novo Redondo have a dialect of Umbundu (Usele) so distinctive that a competent Ocimbundu interpreter has difficulty in making himself understood, or interpreting what is said. Isolation of the Vasele from the Ovimbundu has led to the formation of a cultural pocket in which linguistic developments have shared in a specialization of culture. The differences between the Umbundu of Elende and that of the Ambundu tribes may be noted by comparing this brief outline of Umbundu, recorded at Elende, with the records of Amandus Johnson, whose research relates to the language spoken in the hinterland of Loanda. The present chapter will deal only with notes on vocabulary, phonetics, an outline of grammar, sign language, folklore and proverbs, all of which are briefly treated. In the field phonographic records of the Umbundu language were taken, and for the analysis of tonal values and other aspects of phonetics I am indebted to Dr. M. H. Watkins, a student of Professor E. Sapir, formerly of the University of Chicago, now at Yale.

The section on Umbundu grammar conclusively shows Umbundu to be a representative language of the Bantu family of languages. Umbundu possesses all the fundamental characteristics of Bantu speech. The truth of this may be seen by comparing this outline of Umbundu with the analysis of Bantu languages given by A. Werner (*Language Families of Africa*, London, 1925). Moreover, Carl Meinhof (*Grundzüge einer vergleichenden Grammatik der Bantu Sprachen*, Berlin, 1906, pp. 112-115, and translation by A. Werner and N. J. von Warmelo, London, 1932) indicates the degree of relationship of Umbundu to other Bantu tongues by giving comparisons of the stems of personal and possessive pronouns, along with other comparative data.

H. H. Johnston (*A Comparative Study of the Bantu and Semi-Bantu Languages*, Oxford, 1919, vol. I, p. 350) places Umbundu in his Group X; that is, the southwestern group of Bantu languages. Johnston's map indicates that throughout Angola there is a gradual transition from the southwestern Bantu group to that of the southwest Congo, which is exactly what might be expected from a consideration of the geographical position of Angola. Johnston's grouping is based on root forms and vocabulary.

This difficulty of making a comparison of the affinities of Umbundu does not preclude the possibility of recording some preliminary observations, especially with regard to vocabulary.

F. and W. Jaspert have prepared a comparative vocabulary of 250 words in the languages of the Ovimbundu, the Luena, the Basongo, the Luchazi, the Luimbi, and the Vachokue tribes. Inspection of the columns indicates a close connection of Songo, Luchazi, and Luimbi; in fact, the vocabularies of the two latter are almost identical. The vocabularies of the Vachokue and the Luena have much in common with those mentioned, but the Umbundu vocabulary has only a minor agreement with the vocabularies of these eastern and northeastern tribes. There are, however, some words which are identical in all these languages mentioned by F. and W. Jaspert. Examples of identity, or very close similarity, are found in the words for "bow," "elephant," "to eat," "firestick," "finger," and a few other forms, but the principal deduction from inspection of the columns is the distinctiveness of the Umbundu vocabulary.

On the contrary, examination of the vocabularies of the Ovimbundu and the Vakuanyama, of the south of Angola, appears to justify Johnston's inclusion of Umbundu with southwestern Bantu in so far as similarity of vocabulary is a criterion. The correspondence is further borne out by P. H. Brincker's "*Lehrbuch des Oshikuanyama*." In the light of these comparisons the relationship of Umbundu vocabularies is readily seen, for instead of searching for similarities the numerous identities are at once evident. At a glance one sees that the Umbundu and Kuanyama words for "arm," "arrow," "ax," "banana," "beard," "bird," "blood," "bone," "breast," "charcoal," "guinea fowl," "hand," and "hoe," are either identical or closely related. I noted the easy communication of my Ocimbundu interpreter with the Vakuanyama of Mongua.

Some of the following chapters show that the Ovimbundu have an undeniable southwest Congo culture; they have, however, taken

cattle and a few other traits from the Vakuanyama of southern Angola, and there seems to be no doubt that the vocabularies of the Ovimbundu and the Vakuanyama have been influenced by these southern contacts. Yet structure will prove the final arbiter in deciding linguistic relationships, for the Ovimbundu as extensive travelers have widely distributed their vocabulary.

Caution is necessary in making comparisons of Umbundu with surrounding languages; for, although Kuanyama has received careful attention, and the researches of Meinhof have given a reliable background for Ovambo and Herero speech, the language of the Vachokue of eastern Angola and the speech of the Mussurongo of northern Angola, call for a comprehensive work. Moreover, there yet remains the task of providing a standard Umbundu dictionary and grammar, and pending the collation of this linguistic material there are no means of determining the exact syntactical, phonetic, and other relationships of Umbundu.

#### VOCABULARY

Apart from a broad question of the linguistic evidence of culture contacts, there are points of interest connected with the recording of vocabularies in a restricted area. Under the heading "Nature Lore" attention was called to an extensive Umbundu vocabulary connected with those activities which underlie the economic structure. The vocabulary showed that the Ovimbundu are keen observers whose activities have resulted in the formation of a large vocabulary arising from trades and occupations. In nature study many fine distinctions are made; thus, there are words to distinguish not only trees and plants of economic importance, but varieties of snakes and lizards which are of no great economic interest.

In order to test further mental activity and the acquisition of vocabulary, an Ocimbundu girl of about twelve years of age was asked to name some of the objects in my collection. Without hesitation she made the following list. The object was indicated, then the child gave the name. This information was checked by an adult interpreter who found that the child was correct in every instance, although the objects do not specially appeal to the interests of a young girl.

The objects named by this girl are as follows:

<i>Ocimanda.</i> Wooden dish.	<i>Ukinda.</i> Switch made from the tail of an ox.
<i>Omulopa.</i> Tobacco-pipe made from a horn.	<i>Opatalonya.</i> Leather pouch for belt.
<i>Etenga.</i> Pipe for smoking hemp.	<i>Upi.</i> Pounding stick.
<i>Ocinunga.</i> Brass bracelet.	<i>Ombenje.</i> Gourd with a long neck.

<i>Onganja</i> . Large round gourd.	<i>Embungumbungu</i> . Bull-roarer.
<i>Onguwa</i> . Net in which gourd is carried.	<i>Olosangu</i> (singular, <i>olusangu</i> ). Rattles for tying on the legs when dancing.
<i>Ohonji</i> . Bow.	<i>Olumbendo</i> . Wooden flute.
<i>Usongo</i> . Arrow.	<i>Opendu</i> or <i>ocifuamulo</i> . Wooden hair-comb.
<i>Olondovi</i> (plural <i>olondovi</i> ). Bark rope.	<i>Osinja</i> . Long needle used in making mats.
<i>Ombulumbumba</i> . Musical bow.	<i>Onende</i> . Wooden pigeon and dove.
<i>Oñoma</i> . Drum.	<i>Osala</i> . Head-dress worn by kings, warriors, medicine-men and hunters.
<i>Ohuñya</i> . Throwing stick.	Small brush used by medicine-man.
<i>Ohanyanga</i> . Drill for boring wood.	<i>Ociñumañuma</i> . Wooden image of human figure.
<i>Ongombo</i> . Basket used in divination.	<i>Olupunda</i> . Rat trap of cane.
<i>Esanga</i> . Water jar.	<i>Ombutesa</i> . Snuff box.
<i>Ocipupu</i> . Jar for palm oil.	
<i>Ocimbangu</i> . Skin-covered box carried to war by a king.	
<i>Omusaka</i> (diminutive, <i>okamisaka</i> ). Flour-sifter.	
<i>Opesi</i> . Tobacco-pipe.	

The names for colors are restricted to a few words; but in all other respects the Umbundu vocabulary is extensive.

My interpreter said, "When I was learning colors, the women at the school told me many names, but I could see no difference at all." Ngonga contended that there was no difference between the color of a dark blue book and the black box on which it was resting.

The following colors have names. Black is *tekāva*. White is *yela*. Yellow is *ondunga*. Red is *kusukā*. Greens and blues are not well distinguished linguistically, but green is *aniñamboto*. The word *tekāvisa* is used to indicate that a color is not distinctly green or blue. The word *yelisa* is used to describe gray, and all dark reds. *Wumbula* is the term which describes a greenish-blue shade.

A further study of vocabulary was made by asking Ngonga to speak into the dictaphone. In doing so he gave lists of words including nouns in their singular and plural forms, together with many examples of other parts of speech and illustrations of syntax. These records have been transcribed by Dr. M. H. Watkins. (This section was prepared with use of phonetic symbols that were easily available. For the most recent system, see "Practical Phonetics for Students of African Languages," by D. Westermann and I. C. Ward, London, 1933.)

## PHONETICS

### VOWELS

The vowels are *a*, *e*, *i*, *o*, *u*, and perhaps *ə*. They seem to be somewhat lower than the cardinal vowels. There was only one word in which the vowel *ə* was heard, *òpàtalòñà* (leather pouch for a belt). This word, however, appears in the field notes as *opataloña* (*opata-*

*longa*) and the obscure vowel heard might have been a result of imperfection in the record. These vowels are fairly close to the European vowels, their nearest equivalents in the European languages being approximately as represented below:

*a*, as in German *Masse*.

*e*, as in French *été*.

*i*, as in English *machine*.

*o*, as French *eau*.

*u*, as in German *Buch*.

*ə*, as *e* in German *Klasse*, and *a* in *about*.

The nasal vowel *ɑ̃* appears in a fairly large number of words, and the nasal *ɔ̃* is occasionally heard. Before another vowel, *u* takes the sound of *w*: *ɔ̃lwéyɔ̃* (*olu-eyo*), "broom"; *ɔ̃tumáɔ̃lɔ̃ twáŋgɔ̃* (*tu-ayge*), "my little children."

The rising diphthongs *ia*, *ie*, *iu*, and *io* and the falling diphthong *ai* appear in the material, but every combination of two vowels does not make a diphthong. In several instances, when a word terminating in a vowel was followed by another word, the initial letter of which was also a vowel, the final vowel was elided. Final vowels on the low tone tend to vanish; that is, they are only slightly voiced, as in *ásáŋgɔ̃kálúŋgɔ̃* (*ásáŋgɔ̃ ɔ̃kálúŋgɔ̃*), "he found (a) little hole"; *ɔ̃dávélénénɔ̃* (*ɔ̃dávélɔ̃ ènénɔ̃*), "I am big sick." (I am very sick.)

#### CONSONANTS

The table of consonants is as follows:

	Bilabial	Dentilabial	Alveolar	Prepalatal	Palatal	Glottal
Stops { Voiced	<i>b</i>		<i>d</i> , <i>ɔ̃d</i>		<i>g</i>	
{ Voiceless	<i>p</i>		<i>t</i>		<i>k</i>	
Spirants { Voiced		<i>v</i>				
{ Voiceless		<i>f</i>	<i>s</i>			<i>h</i>
Affricatives { Voiced			<i>dʒ</i> , <i>ɔ̃dʒ</i>			
{ Voiceless			<i>tc</i>			
Nasals	<i>m</i>		<i>n</i>	<i>ɲ</i>	<i>ɲ</i>	
Lateral			<i>l</i>			
Semivowels	<i>w</i> and <i>y</i>					

The symbols *ɔ̃d* and *ɔ̃dʒ* indicate "nasal attack" consonants, i.e., the fully pronounced consonants *d*, *dʒ*, and *g* are preceded by their homo-organic nasals not completely formed. It is as if one prepared to make the sound of *n* but before its completion changed to *d* or *dʒ*; likewise the change is made from *ɲ* to *g*. Letter *c* is *ch* as in *church*.

## TONE AND STRESS

Apparently there are three tones in this language, but one cannot be quite sure, since under the somewhat unusual condition of attempting to record his voice on the dictaphone the informant might have distorted the pitch of certain syllables. That three tones can be distinguished when listening to the records, and that these tones tend to follow a definite pattern, for example, in the singular and plural forms of the same word, can be asserted with satisfaction; but there is less assurance in trying to understand all the nuances of these tones and in assigning them, without reservation, a definite place in the phonetics of the language. Nothing short of field work aided by delicate instruments can afford any satisfactory conclusions on this point.

The data did not present any clear instance in which tone had semantic value. That is, there were no examples of two or more words, which, otherwise identical, differed only in tone and meaning.

The field notes state that the difference between cardinal and ordinal numbers is one of tone only, and this was partially verified from the phonographic records, but the words were not clear enough for transcription.

The following words have tones of semantic value, but the phonographic record was not clear. *Kalunga*, according to tone, can mean "god," "sea," "death," or "greeting." *Ombambi* can mean a "fever" (low tone) or a "bush buck" (high tone). *Onjila* means "bird" or "path." *Ombundi* means "gateway" or the root which is commonly used in brewing beer. *Ongongo* means "earth" (middle tone), or "hardship" (high tone).

In this chapter tones are indicated by placing a grave accent (*à*) to indicate a low tone, and an acute accent (*á*) to show the occurrence of a high tone. The middle tone is left unmarked.

The tones are not fixed, and they will be shown to shift in context. For example, a high tone on the penultimate syllable tends to be carried along to the last syllable also. This shifting of tone is especially noticeable when a noun is brought into concord with its qualifying adjective or relative, or when a noun is the subject of a verb. The following are instances in which tones do not maintain their original positions as found in isolated words: *úti*, "tree," *úti únénè*, "large tree"; *òlwéyò*, "broom," *òlwéyò lùwa*, "good broom"; *òmúnù*, "person," *òmúnù útto*, "small person."

This kind of tonal behavior was clearly indicated in five records of single words, and expressions of two words. But in the transcrip-

tions of folklore texts tonal behavior will be seen to be less consistent. Discrepancies in the incidence of tones may be due to different speeds at which words are spoken. The placing of tones is perhaps most reliable when transcriptions are made from free, continuous speech, as in the case of fluent reading, or talking in continuous sentences.

Many words received a definite stress on the last syllable, and in others the penultimate syllable received a light stress. The majority, however, received slight, if any, stress, hence no definite conclusions could be reached on this subject. In several instances it is obvious that the informant was striving to be clear and distinct in pronouncing each syllable; therefore he possibly sacrificed certain characteristics of his intonation.

#### THE SYLLABLE

Every syllable ends in a vowel, consequently a vowel terminates each word, and consonants are pronounced with the following vowel, or with a consonant plus the vowel. The vowel of the penultimate syllable is long when the word stands alone, and in larger sound-groups the vowel is long in the penultimate syllable of the last word, while in the preceding word, or words, the corresponding vowel seems to be only half the length. Vowel length is not indicated in these transcriptions.

#### GRAMMAR

##### THE CLASS SYSTEM

The data available were sufficient to establish the following classes of nouns, on the basis of their prefixes in the singular and plural; the formation of the adjectival or relative concords was likewise noted. There is no assurance that this list is exhaustive.

CLASS	PREFIX		RELATIVE	
	Singular	Plural	Singular	Plural
1.	omu-, omo-	oma-	u-	va-
1a.	u-	a-, ova-	u-	va-
2.	u-, oku-	ovo-	u- (ku-)	a-
3.	u-	ovi-, i-	u-	vi-
4.	o-	olo-	yi-	vi-
5.	olu-	olo-, a-	lu-	vi-, a-
6.	otci-	ovi-, i-	tc-	vi-
7.	e-	a-, ova-	li-	a-
7a.	-, i-	ova-	li-	a-
8.	oka-	otu-	ka-	tu-

According to the principle of concord, the noun prefix is the governing element which determines the concordial agreement of parts of speech when these are brought into relationship with the noun. The prefixes also indicate number and, together with the

concordial agreement as stated above, divide the nouns into several classes or class genders. We need not enter upon a general discussion of concord, which in the Bantu languages is a method of expressing grammatical relations that are of fundamental importance. Concord need not always appear in the form of perfect alliteration, although it frequently does so, for the essential fact is that all nouns of the same class are recognizable as such, and other elements of speech when brought into syntactic agreement with these nouns must carry similar distinctions.

Students of Bantu have suggested that the various noun classes probably represent a proto-Bantu classification which formerly betokened a grouping based on common characteristics (A. Werner, Some Bantu Linguistic Problems, *Jour. Afr. Soc.*, XXVIII, 1928-29, pp. 155-165). The nouns listed here under Class 1 may accordingly be recognized as belonging to the so-called personal class, and the prefixes of Class 8 indicate a diminutive class.

## CLASS 1

SINGULAR PREFIX: <i>omu-</i> , <i>omo-</i>	RELATIVE: <i>u-</i>
PLURAL PREFIX: <i>oma-</i>	RELATIVE: <i>va-</i>
<i>omúnu</i> , person	<i>omólá</i> , child
<i>ománu</i> , people	<i>omáqla</i> , children

Illustrations of concordial agreement with these nouns:

<i>omúnu útito</i> , small person	<i>omólá útito</i> , small child
<i>ománu vátito</i> , small people	<i>omáqla vátito</i> , small children

## CLASS 1A

SINGULAR PREFIX: <i>u-</i>	RELATIVE: <i>u-</i>
PLURAL PREFIX: <i>a-</i> , <i>ova-</i>	RELATIVE: <i>va-</i>
<i>ulume</i> , man	<i>ufeko</i> , girl
<i>alume</i> , men	<i>afeko</i> , girls
<i>ováume</i> , men	<i>ováfeko</i> , girls
<i>ukqi</i> , woman	<i>umalehe</i> , lad
<i>akqi</i> , women	<i>amalehe</i> , lads
<i>ovákqi</i> , women	

The following forms show the concordial agreement for Class 1A:

<i>ulume útito</i> , small man	<i>akqi vátito</i> , small women
<i>alume vátito</i> , small men	<i>ovákqi vátito</i> , small women
<i>ováume vátito</i> , small men	<i>afeko vene (va-ene)</i> , your (pl.) girls
<i>ukqi útito</i> , small woman	<i>amalehe vávò</i> , their lads

## CLASS 2

SINGULAR PREFIX: *u-*, *oku-*RELATIVE: *u-*, *ku-*PLURAL PREFIX: *ovo-*RELATIVE: *a-**ulá*, bed*òkùlù*, leg*òvólá*, beds*òvólù*, legs*uta*, gun*okwókwó*, arm*òvóta*, guns*òvókwó*, arms

Concordial agreement for Class 2:

*ulá ònénè*, large bed*òvóta àtító*, small guns*òvólá ànénè*, large beds*òkùlù kùtító*, small leg*uta ùtító*, small gun*òvólù àtító*, small legs

## CLASS 3

SINGULAR PREFIX: *u-*RELATIVE: *u-*PLURAL PREFIX: *ovi-*, *i-*RELATIVE: *vi-**úti*, tree*ítima*, heart*òviti*, trees*òvitima*, hearts*úpi*, handle*ítima*, hearts*òvìpi*, handles

Concordial agreement for Class 3:

*úti ònénè*, large tree*ítima ùtító*, small heart*òviti vìnénè*, large trees*òvitimá vitító*, small hearts

## CLASS 4

SINGULAR PREFIX: *o-*RELATIVE: *yi-*PLURAL PREFIX: *olo-*RELATIVE: *vi-**òndjó*, house*òngómbè*, ox*òlòndjó*, houses*òlòngómbè*, oxen*òmángú*, chair*òngùlù*, pig*òlómángú*, chairs*òlòngùlù*, pigs

Concordial agreement for Class 4:

*òndjó yiwa*, good house*òlómángú vitító*, small chairs*òlòndjó viwa*, good houses*òngùlù yínénè*, large pig*òmángú yitító*, small chair*òlòngùlù vìnénè*, large pigs

## CLASS 5

SINGULAR PREFIX: *olu-*RELATIVE: *lu-*PLURAL PREFIX: *olo-*, *a-*RELATIVE: *vi-*, *a-**òlùñlì*, fly*olwì (olu-i)*, stream*òlòñlì*, flies*òlòndwì*, streams*òlùhéngò*, wild plum*òlwéyò*, broom*òlòhéngò*, wild plums*òlòndwéyò*, brooms*àlwéyò*, brooms

## Concordial agreement for Class 5:

<i>òlúńí lútító</i> , small fly	<i>òlúéyó lúwa</i> , good broom
<i>òlónít vítító</i> , small flies	<i>òlòndwéyó vùwa</i> , good brooms
<i>òlú lùnéne</i> , large stream	<i>òlúéyó òwa</i> , good brooms
<i>òlòndwí vinénè</i> , large streams	

## CLASS 6

SINGULAR PREFIX: <i>otci-</i>	RELATIVE: <i>tcí-</i>
PLURAL PREFIX: <i>ovi-, i-</i>	RELATIVE: <i>vi-</i>
<i>òtcímúnù</i> , thief	<i>itúnù</i> , pits
<i>òvimúnù</i> , thieves	<i>òtcítá</i> , one hundred
<i>imúnù</i> , thieves	<i>òvitá</i> , hundreds
<i>òtcítúnù</i> , pit	<i>òtcípá</i> , skin
<i>òvitúnù</i> , pits	<i>òvípá</i> , skins

## Concordial agreement for Class 6:

<i>òtcítúnù tciménè</i> , large pit	<i>òtcípá tcùwa</i> , good skin
<i>òvitúnù vinénè</i> , large pits	<i>òvípá vùwa</i> , good skins

## CLASS 7

SINGULAR PREFIX: <i>e-</i>	RELATIVE: <i>li-</i>
PLURAL PREFIX: <i>a-, ova-</i>	RELATIVE: <i>a-</i>
<i>eká</i> , hand	<i>òvápákò</i> , fruits
<i>òváká</i> , hands	<i>ápákò</i> , fruits
<i>epiá</i> , field	<i>èkándù</i> , wrong
<i>òvápíá</i> , fields	<i>òvákándù</i> , wrongs
<i>ewé</i> , stone	<i>òkándù</i> , wrongs
<i>òvávé</i> , stones	<i>èpúmù</i> , corncob
<i>èpákò</i> , fruit	<i>ápúmù</i> , corncobs

## Concordial agreement for Class 7:

<i>eká lítító</i> , small hand	<i>epiá lùwa</i> , good field
<i>òváká àtító</i> , small hands	<i>òvápíá òwa</i> , good fields

## CLASS 7A

SINGULAR PREFIX: <i>-, i-</i>	RELATIVE: <i>li-</i>
PLURAL PREFIX: <i>ova-</i>	RELATIVE: <i>a-</i>
<i>imbò</i> , belly	<i>isó</i> , eye
<i>òvájimbò</i> , bellies	<i>òvásó</i> , eyes

## Concordial agreement for Class 7A:

<i>imbò lùnéne</i> , large belly	<i>òvásó àtító</i> , small eyes
<i>òvájimbò ànéne</i> , large bellies	<i>imbò lùóngómbè</i> , belly of ox
<i>isó lítító</i> , small eye	<i>òvájimbò òlóngómbè</i> , bellies of oxen

## CLASS 8

As previously stated, the prefixes of this class signify diminutive forms. In Chewa, one of the languages spoken in Nyasaland Protectorate, these prefixes and the augmentative prefixes when used with the personal nouns convey a somewhat derogatory meaning. In Zulu the diminutive and augmentative suffixes, although not determining classes, are likewise of this nature when employed with nouns of the personal class. The records upon which this brief description of Umbundu is based were not clear on this point, but I note that *-tito* means "small," so that the distinction between *ðkalume* ("little man") and *ulume titito*, translated in the field notes as "small man," may be of considerable importance. Likewise, *ðtɕmɛnɛ* ("thief"), Class 6, may be an augmentative-derogatory form in origin, provided that there is an augmentative class and that it coincides with Class 6.

SINGULAR PREFIX: *oka-*RELATIVE: *ka-*PLURAL PREFIX: *otu-*RELATIVE: *tu-**ðkándjo*, little house*ðtwalume*, little men*ðtúndjo*, little houses*ðkatɕpɔ*, little skin*ðkalume*, little man*ðtuwípɔ*, little skins

Concordial agreement for Class 8:

*ðkamɕlɔ káwa*, good little child*ðtumɕlɔ túwa*, good little children*ðkándjɔ kðɣgúlɛ*, little house of (the) pig*ðtúndjɔ twðlɔɣgúlɛ*, little houses of the pigs

## PRONOUNS

The personal pronouns are given below. Those for the third person are obviously Class 1 pronouns. Pronouns for the other classes were not obtained. These forms are of the independent or absolute type.

	Singular	Plural
FIRST PERSON	<i>ámè</i>	<i>étù</i>
SECOND PERSON	<i>óvè</i>	<i>énè</i>
THIRD PERSON, Class 1	<i>eyé</i>	<i>ávð</i>

The possessive pronominal stems are to a great extent identical with the absolute forms, but follow the nouns which they qualify, and are preceded by the concord of the thing possessed and the qualificative formative (*a*). In some instances this formative is

elided. Again, for the third person we can give only the forms of Class 1.

	Singular	Plural
FIRST PERSON	- <i>ngè</i>	- <i>etu</i> (ç)
SECOND PERSON	- <i>òvè</i>	- <i>ene</i> (ç)
THIRD PERSON, Class 1	- <i>hè</i>	- <i>vò</i>

(ç) Note that the tone differs from that of the "absolute" forms.

Examples of the use of the possessive:

<i>òtèitùñú tçángè</i> , my pit	<i>ukqi wetu</i> , our woman
<i>òtèitùñú tçónè</i> , your pit	<i>akqi vetu</i> , our women
<i>òtèitùñú tçáhè</i> , his (Class 1) pit	<i>útì wòvè</i> , your tree
<i>òtèitùñú tçetu</i> , our pit	<i>ovítì vjène</i> , your (pl.) trees
<i>òtèitùñú tçene</i> , your (pl.) pit	<i>útì wáhè</i> , his (Class 1) tree
<i>òtèitùñú tçávò</i> , their (Class 1) pit	<i>útì wávò</i> , their (Class 1) tree
<i>òvòtùñú vjángè</i> , my pits	<i>ovítì vjávò</i> , their (Class 1) trees
<i>òvòtùñú vjávò</i> , their (Class 1) pits	<i>òndjò yetu</i> , our house
<i>òmúnú wángè</i> , my slave	<i>òndjò yene</i> , your (pl.) house
<i>òmúnú wòvè</i> , your slave	<i>òndjò yávò</i> , their (Class 1) house
<i>òmúnú wáhè</i> , his (Class 1) slave	<i>òlòndjò vjetu</i> , our houses
<i>òmánú vángè</i> , my slaves	<i>òluhéngó lwángè</i> , my wild plum
<i>òmánú vòvè</i> , your slaves	<i>òluhéngó lwòvè</i> , your wild plum
<i>òmánú váhè</i> , his (Class 1) slaves	<i>òluhéngó lwáhè</i> , his (Class 1) wild plum
<i>òmánú vetu</i> , our slaves	
<i>òmánú vene</i> , your (pl.) slaves	<i>òkamplá kángè</i> , my little child
<i>òmánú vávò</i> , their (Class 1) slaves	<i>òkándjò kòvè</i> , your little house
<i>ukqi wángè</i> , my woman (my wife)	<i>òtùndjò twòvè</i> , your little houses
<i>ukqi wòvè</i> , your woman	

The following examples of syntax were not recorded on the dictaphone, therefore they have not been phonetically analyzed.

The verb stem is seen in the imperative singular:

<i>tunga</i> , build (thou)	<i>tìla</i> , flee (thou)
<i>tunga ondjo</i> , build the house	

Example of imperative plural ending with *i*:

<i>tungì</i> , build ye	<i>tìlì</i> , flee ye
-------------------------	-----------------------

#### PRINCIPAL TENSES

##### FUTURE

The following examples suggest that there is no formal distinction between the present and the future:

- ndi tunga onjo* or *nunga onjo*, I shall build the house
- o tunga onjo*, you will build the house

*o tunga onjo*, he will build the house  
*tu tunga onjo*, we shall build the house  
*vu tunga onjo*, you will build the house  
*va tunga onjo*, they will build the house  
*omunu o tunga*,<sup>1</sup> a person builds  
*omanu va tunga*, the people build  
*omiapia yi tunga*, a swallow builds  
*olomiapia vi tunga*, swallows build  
*eveke li tunga*, the fool will build  
*ocimunu ci tunga*, the thief will build  
*ovimunu vi tunga*, the thieves will build  
*okamola ka tila*, the little child will flee  
*otumala tu tunga*, the little children will build  
*olusenge lu tila* (monitor lizard), the lizard will flee

## PAST

*nda tunga onjo*, I built the house  
*wa tunga onjo*, you built the house  
*wa tunga onjo*, he built the house  
*tua tunga onjo*, we built the house  
*va tunga onjo*, they built the house  
*ocimunu ca tila*, the thief fled  
*ongombe ya tila*, the ox fled  
*eveke lia tila*, the fool fled  
*okamola ka tila*, the little child fled  
*omunu wa tila*, the person fled

The pronoun as object comes between the prefix and the verb:

*ombua ya ci lumana*,<sup>2</sup> the dog bit it  
*ocimunu co lumana*, the thief bit him  
*cu lumana*, it will bite him  
*olusenge emalanaga lu lilumana*, the lizard will bite the cheetah  
*okamola olunyihl lua ka lumana*, the little child, the bee stung him

The perfect tense uses the prefix of the past tense with *-ile* or *-ele* added to the stem of the verb. The perfect is used to indicate an action in some definite past time, or to state a condition which has ceased:

*ulume wa solele ukai wake*, the man used to love his wife  
*helāombuayalumanele omunu (ulume)*, yesterday the dog bit a man

<sup>1</sup> The *o* is not a pronoun but is used to preserve concord.

<sup>2</sup> The letter *y* is part of the concord. The letter *y* survives from the personal pronoun *eye* meaning "he." Letter *a* indicates past tense; *ci* means "it" or "thing." Hence the literal meaning is "dog he thing bit."

*enya muale va tungile olonjo*, last year they built the houses

The causative is expressed by the suffix *-isa*:

*va tungisa onjo*, they caused the house to be built

*o tongisa ombinja*, he will cause a shirt to be sewed

The suffix *-ila* has the force of a preposition:

*ombua ya tilila konjo*, the dog fled to the house

*olusenge lua fila vocitunyu*, the lizard died in the pit

Illustrations of indirect object:

*va tungila ukai onjo*, he built the house for the woman

*va tu tongela olombinja*, they sewed the shirts for us

The prefix *oku* is the sign of the infinitive:

*oku tunga*, to build

*oku tila*, to flee

*oku lia*, to eat

The subjunctive is expressed by changing final *a* to *e*:

*a tunge onjo*, let him build the house

*va tile*, let them flee

*va sia epangu okuti oco ovava a pite*, they left a hole so that the water might pass

The auxiliary *ka* ("to go") is used with all tenses:

*o ka tunga kimbo*, he will go and build at the village

*wa ka tunga onjo*, he has gone to build a house

*wa ka tungile onjo*, he has been there and built a house

The negative is expressed in the following words:

*si tungi*, I shall not build

*ku tungi*, thou wilt not build

*ka tungi*, he will not build

*ka tu tungi*, we will not build

*ka va tungi*, they will not build

*ongombe ka yi tungi*, the ox will not build

*ocimunu ka ci tungi*, the thief will not build

*olusenge ka lu tila*, the lizard will not flee

*okamola ka ka tungi*, the little child will not build

*ukai ka tungi*, the woman will not build

The past negative is expressed as follows:

*sa tungile*, I did not build

*kua tungile*, you did not build

*ka tungile*, he did not build

*ka tua tungile*, we did not build

*ka wa tungili*, you did not build  
*ka va tungile*, they did not build  
*omanu ka va yongola oku tila*, the people do not wish to flee  
*ocimunu ka ci yongola upange*, the thief does not wish work  
*ha ngombe ko*, it is not an ox  
*ha njoko*, it is not a house  
*ha munuko*, it is not a person  
*ha manuko*, they are not people  
*ha ci munuko*, he is not a thief  
*ha meko*, it is not I  
*he yeko*, it is not he  
*ha veko*, it is not you  
*he tuko*, it is not we  
*he neko*, it is not you  
*ha voko*, it is not they  
*si ci munuko*, I am not a thief  
*ku ci munuko*, you are not a thief  
*ha ci munuko*, he is not a thief  
*ka tui munuko*, we are not thieves  
*ka wi munuko*, you are not thieves  
*ha i munuko*, they are not thieves

## TRANSCRIPTION OF FOLKLORE STORIES

<sup>1</sup>Presumably an adoption of the well-known European fable of the dog and his reflection.

*Sómá* *Tciyúkà*  
King Tciyuka

<i>Sómá</i> King	<i>Tciyúkà</i> Tciyuka	<i>òmǵlǵ</i> son	<i>à</i> of	<i>djǵǵǵ</i> John	<i>wàéndà</i> went	<i>ku</i> to	<i>Kangándjǵ</i> Kangandji
<i>òkùlǵà</i> to eat (impose)	<i>òvimbù.</i> fines.	<i>Vàti</i> They	<i>tambùla</i> "Take	<i>tǵà sǵkà.</i> that which is proper.	<i>Kǵkwéne</i> Among yourselves		<i>kùlivo</i> there are also
<i>òvimbù</i> fines	<i>vǵétù.</i> of ours."	<i>Eyè</i> He	<i>Tciyúkà</i> Tciyuka	<i>hàti,</i> said, "There	<i>kwa</i> was	<i>kǵǵle</i> once	<i>ùkǵǵǵ</i> a hunter
<i>wà</i> who	<i>kà lǵle</i> went (and) imposed	<i>òvimbù,</i> fines;	<i>wà</i> he	<i>tambùla</i> received	<i>òpǵù.</i> (a) stick.		<i>Okwiyá</i> Coming
<i>kǵndǵǵla</i> along the path	<i>wà yévd</i> he heard	<i>ondǵuvǵǵgo</i> a rustling	<i>yétàtù</i> of iguana	<i>lomǵlǵ</i> with children	<i>váhè.</i> his.		<i>Eyè</i> He
<i>wàtlǵà</i> fled;	<i>wà lǵndà</i> he climbed	<i>vùti</i> tree	<i>lùta</i> with gun	<i>wáhè.</i> his.	<i>Opǵù</i> (The) stick	<i>yasǵala</i> remained	<i>pǵsi.</i> down (on the ground).
<i>Nǵke</i> After- ward	<i>ètàtù</i> iguana	<i>òkwiyá</i> coming	<i>wàmǵlǵà</i> saw	<i>òpǵù</i> stick;	<i>hàti,</i> said,	<i>"dà lǵlǵ.</i> 'I have seen.'	<i>Ukǵǵǵ</i> Hunter
<i>hàti</i> said,	<i>kǵtǵkǵ</i> 'Not so	<i>òpǵù</i> stick	<i>yǵǵǵ.</i> my.'	<i>Etàtù</i> Iguana	<i>hàti</i> said,	<i>"dàti.</i> 'No.	<i>"Dà</i> If
<i>yǵvè</i> yours	<i>"dà</i> then	<i>wa lǵndà</i> you (would) have climbed	<i>lǵyǵ.</i> with it.'	<i>Nǵke</i> After- wards	<i>ètàtù</i> iguana	<i>wàtǵmbùlǵà,</i> took (it),	<i>wàétǵà</i> he gave (it)
<i>kǵmánù.</i> to the people.	<i>Ukǵǵǵ</i> Hunter	<i>wàpǵmbà,</i> lost,	<i>wàtǵndǵpǵ</i> (he) went away	<i>òvǵkǵ,</i> empty handed,	<i>wàéndà</i> (he) went		
<i>kǵmbǵ</i> to village	<i>lǵávǵ.</i> his.						
<i>Nǵké</i> "Afterward	<i>wàlǵlǵkǵà</i> he invited	<i>òndǵjévd</i> a hunt	<i>voǵcisùkù,</i> of the tall grass,	<i>ótǵó</i> so that	<i>tcósi</i> all		
<i>tcápǵà.</i> was burned.	<i>Etàtù</i> Iguana	<i>hámǵ</i> however	<i>akǵlǵà</i> was	<i>voǵcisùkù.</i> in the tall grass.	<i>Hàti</i> He said,	<i>òvǵándǵà</i> 'One looks	<i>òkǵ</i> where
<i>a tǵlǵla</i> one may flee	<i>kà kù</i> it does	<i>moléha.</i> not appear.'	<i>Otcó</i> Then	<i>àsǵǵǵà</i> he found	<i>òkǵlǵǵǵǵ,</i> a little hole,	<i>hàti</i> he said,	
<i>iyǵlǵkǵ</i> '(I will) enter there.'	<i>kà</i> He could not be contained (in it).	<i>swǵkǵ.</i> (The) body	<i>Etǵmbá</i> (The) body	<i>lǵàǵǵlǵà,</i> entered,	<i>utǵlǵà</i> the tail	<i>wàǵǵlǵà</i> was left	

*pòsámwà.* *Nóké* *ùkóngò* *wéyà.* *Hàtì* *òvándjà* *utclà*  
outside. Afterwards hunter came. (He) said, 'One sees (the) tail

*wètàtù* *pòsámwà.* *Leye* *hàtì,* *ⁿdà lùlù.* *Etàtù* *hàtì*  
of the outside.' And he said, 'I have seen.' Iguana said,

*kòtókò* *òtò* *ètimbà* *lìàngè.* *Ukóngò* *hàtì* *kòtókò.*  
'Not so that (is) body my.' Hunter said, 'Not so.

*ⁿDá* *lìákàlè* *lìòvè* *ⁿdà* *lìàtìlù.* *ⁿOké* *ùkóngò*  
If it had been yours it would have entered.' Afterward hunter

*wàñagúlà* *òmókò* *yáhè,* *wà tètà.* *Otò* *ètàtù* *lìáfà.*  
(he) stretched knife his, he cut. Thus iguana died."

*Otò* *Tcìyukà* *hàtì,* *amé* *ⁿdìá* *tcàngè.* *Noké*  
So Tciyuka said, "I shall eat mine. After

*ⁿdà* *ḡwètè* *tcénè,* *lámè* *wìyì,* *ù* *lìsàngélà.*  
if I have yours, with me come, you with it will  
find yourselves."

### *Hósi la ⁿGúli* Lion and Hyena

*Tcìsukilá* *wà tumilá* *kusómá* *Tcìpóngè* *hàtì,* *a ende*  
Tcisukila sent to king Tciponge, said, "Let him go

*a* *katùle* *ukùlu* *ìnénè* *lòvákwendje.* *Veye* *va* *leméle*  
he you cause (an) elder great with young Let them they may  
that to arise men. come warn

*ofeká* *yàngè,* *yá* *ⁿómà.* *Sómá* *Tcìpóngè* *ḡu* *wà tela*  
country my, which despises me." King Tciponge he told

*òlúsápò* *hàtì,* *kwá kála* *òḡgúlì,* *òmánù* *vòsì* *vo leválà*  
a proverb, said, "There was hyena, people all from him  
borrowed

*tcáhè.* *ⁿGúli* *etci* *wà èndá* *kímbo* *vò háḡga* *lovótà*  
his Hyena when (he) went to village they him  
(things). drove off with  
guns

*lòlohóndjì.* *ⁿOkè* *tcovála* *kutímà* *hàtì,* *ha* *sembiká*  
and clubs. Then it him to (the) he said, 'I go I engage  
hurt heart

*ku hósi,* *eyé* *ò* *téla* *oku* *kwátà* *òmánù.* *Etcì* *a* *sàngà*  
(to) lion he is able to catch people.' When he found

*hósi,* *hósi* *hàtì,* *twendá* *ku* *bùlù* *o* *kwètè* *esúḡgà,* *eyé*  
lion, lion said, 'Let us go to jackal he has honesty he

*òtèmbanda* *tcínénè.* *Otò* *hósi* *laⁿgúli* *và líkwáḡ* *oku èndá*  
(is) medicine- great.' So lion and hyena they followed to go  
man each other

*ko bulù.* *Bulù* *hàtì,* *tu* *vándjilíyá* *imbó* *lìovisòndè.* *Otcó*  
to jackal. Jackal said, 'We shall search village of driver ants. Thus

*amé* *ndjimbemó* *utcilá* *wáγγè.* *Ené* *usiálá* *koféká.*  
I thrust in tail my. You remain in country (outside).

*Amé* *ndjigilá* *vimbo* *oko* *ñilá* *ovisòndè* *vimbo*  
I shall enter there I shall sprinkle driver ants in the village

*lìósì.* *Ománú* *étci* *vatundá* *ove* *u hósì* *wendá* *loku kwátá.*  
all. People when they come you O lion go (them) to catch.

*Otcó* *tca* *soká* *oku* *fetà* *ofuka* *ya "gúli.* *Oká* *sapúlá*  
So that shall be to pay debt of hyena.'" This one tells

*ku* *Tcisukilá,* *"dá yátúlá* *ukúlu* *lákwendjè* *velómbe*  
to Tcisukila, "Should I cause (an) elder with young from the court

*tca soká* *oku sándúlá* *oféká* *yáhè,* *mómó* *amé*  
it (would) to scatter country his, for I  
be equal

*"dumúnú* *ónénè.* *Ové a* *Tcisukilá,* *lemelá* *ofeká* *yóvé*  
am (a) great. You Tcisukila, warn country your  
person

*evándò* *ótó* *u kála* *tciwá.*  
slowly so you shall be well."

### *Hósi lá Bindjì* Lion and Wild Dog

*Hósi* *wa* *túγγá* *kùséγγè.* *Wà kúka.* *Kà* *kwète* *òγγúsù*  
Lion he built in the woods. He was old. He had not strength

*yòkù Ìmwísa* *òkúlá.* *Wà sóka* *òkù* *lúγγúká.* *Yú* *wèndà*  
to provide food. He thought to be cunning. He went  
himself

*kèléva,* *wà yáílá* *kohondo,* *walúviktya* *òkù vélá.*  
to cave, he crawled to a corner, he made out to be sick.

*Ovĩnamá* *vìósì* *vìéyá víò* *vándjá,* *"dá* *ò vélá* *òtíllì.*  
The animals all came they looked, if he is sick indeed.  
at him

*Ètci* *vìéyá* *hósì* *ò* *lóku* *vì* *takáílá.* *Ètci* *ovĩnama* *vìálhwa*  
As they lion he them ate. When animals many  
came

*vía* *kwáttwa* *lá* *hósì,* *bindjì* *wéya* *wà lúγγá.* *Eye* *ò táí*  
they were by lion, wild he came he took He stands  
caught dog warning,

<i>kuvélò</i> at open- ing	<i>wèlèvò.</i> of the cave.	<i>Wà pùla</i> He asked	<i>hósi</i> lion,	<i>hàti,</i> saying,	<i>wàkólápó.</i> “Are you well?”	<i>Hósi</i> Lion	<i>hàti,</i> said,	
<i>“da</i> “I am	<i>vèlâ</i> sick	<i>enénè.</i> very.”	<i>Wâ</i> He	<i>lâleka</i> invited	<i>bîndji</i> wild dog	<i>òku òyílâ</i> to enter	<i>vèlèva</i> into the cave	<i>òku</i> to
<i>vàngula</i> talk	<i>lâhè.</i> with him.	<i>Bindji</i> Wild dog	<i>wâ</i> he	<i>kúmbúlúlâ</i> replied	<i>hàti,</i> saying,	<i>“da távâ,</i> “I should have agreed	<i>pwâí</i> but	
<i>“da</i> I	<i>lîmbúka</i> noticed	<i>àkàsà</i> tracks	<i>òsì</i> all	<i>àmbâ</i> go	<i>òvàsò</i> toward	<i>kèlèvâ.</i> the cave.	<i>Kâ</i> There	<i>kùk</i> are
<i>àkàsà</i> no tracks	<i>àmbâ</i> going	<i>òvàsò</i> toward	<i>pòsâmwâ.</i> the outside.”		<i>Tcâ</i> That which	<i>lîyguâ</i> goes	<i>mbwí</i> down? (sinks)	<i>tçâ</i> it
<i>lîngísá</i> warns	<i>avâ</i> those	<i>vâ</i> who	<i>ywâ.</i> swim.					

## SIGN LANGUAGE

Various language signs are in use. The action of throwing a mat on the ground and laying the head on the hands indicates sleep. Inquiry about the health of a father may be made by stroking an imaginary beard. If the father is strong and well the reply will be a flexion of the forearm to harden the biceps.

There are dumb signs for numbers:

(1) The right hand is used to bend the little finger of the left hand into the left palm.

(2) The little finger and the one next to it on the left hand are turned over into the palm.

(3) Three fingers are turned inward.

(4) Four fingers are turned inward.

(5) Four fingers and the thumb are turned inward. The thumb is then tapped with the index finger of the right hand.

(6) The right hand is extended and the thumb of the left hand is placed on the little finger of the right hand. This action adds one to five.

(7) The right hand is extended, then the thumb of the left hand is placed on the little finger and the one next to it. This adds two to five.

(8) The thumb of the left hand is placed on the extended little finger, middle finger, and third finger of the left hand.

(9) Four fingers of the right hand are placed on the thumb of the extended left hand.

(10) The hands are placed together palm to palm.

A very insulting sign is made in this way. The left arm is held up with the fist closed. The left wrist is grasped with the right hand. The left fist is then shaken while the right hand is still grasping the left wrist. "This is done when a man is very angry, and he cannot find words."

A bending forward of the head accompanied by wide opening of the eyes and protrusion of the tongue means "you're a fool."

Shaking the head means "no." If the right hand is shaken in front of the face with the index finger extended, a negative is implied. Nodding the head is an affirmative sign. To indicate absence of anything, or the completion of something, the index finger of the right hand is drawn across the mouth. Rubbing the palms together rapidly has the same significance. In order to call some one the right arm is extended with the palm down. If they summon some one from a distance the arm is lowered, while a scratching movement is made with the fingers. The sign indicating "go away" is a flipping of the hand outwardly, while the arm is extended.

#### RIDDLES AND PROVERBS

"There is a red belt round our field. What is it?" The answer is, "red ants."

"We have somebody who lies all his life in our field. He always lies on one side." The answer is, "a squash."

"We have a stump in the house that is always burning and always moving." This is a metaphor rather than a riddle. The stump is the log which is pushed forward into the fire. It is always alive yet is gradually dying. The saying is intended to refer to human lives. People are alive but their lives are becoming shorter each day.

"What is it that we eat above and below the ground?" The answer is, "manioc, because the leaves and roots are eaten."

"The turtle cannot climb up on a stump, some one has to put it there." This is said in reference to some person who gains a high position which he could attain only by influence and not through merit.

When a person makes threats without being able to fulfil them the following expressions are appropriate: "Hot water does not

burn a house." "Cold water does not make mush." "A sleeping dog does not catch a hare."

If advice is given and disregarded, or if an effort fails and has seemed likely to do so, the people say, "Bark rope comes from a tree; if it does not come, leave it there."

"He who sits by a pot of honey does not soon leave it." This means that a man does not readily leave that which he enjoys.

"When eating honey a man does not put in his finger only once." A good thing is not used in small portions; or, one goes back to a good thing.

When two people have a secret there is a saying, "They uncovered the pot, ate a little honey, and covered it up again."

"If you are full of food, do not climb on a leopard's back." If you yourself are not hungry, this does not imply that the leopard has no appetite. In other words, do not be foolish through good fortune.

"He caught no fish and lost his bracelet." This is said when an object of value is lost while performing a task of small importance. This saying would be applied to an instance of a man who left his work to take up a task for smaller payment.

"If it is not heavy, it is not worth while." That which is desirable is deserving of some effort for attainment.

The fact that something can be accomplished by a number of united people is expressed by the saying, "Where there is a crowd there is a bridge."

"You may throw away what is in the hand, but you cannot throw away what is in the heart." It is difficult to dismiss important matters from mind.

"You cannot tie a buck's head in a cloth. The horns will stick out." This means that a crime cannot be concealed. Murder will out.

"That which destroyed the buck came from its own head." The hunter's whistle is a buck's horn. This means that man is the cause of his own troubles.

"A chicken knows a dangerous thing." The implication is that a man should know.

The English expression, "six of one and half a dozen of the other," is expressed by the Umbundu, "If it is on cattle or on people it is still a louse."

## FOLKLORE STORIES

## THE LEOPARD AND THE HARE

A hare said to a leopard who was about to eat him, "Don't eat me, I will give you something good." Holding out his hand the hare said, "I have a little bit of something good in my hand now, taste it."

This was honey that the hare gave to the leopard, who licked his mouth and said, "This is a good thing that you have given me."

The hare promised to bring some more honey to the leopard. Next morning the hare went to the woods, collected a swarm of bees and placed them in a gourd under a covering of honey. The hare told the leopard to gather his wife and family into a hut, saying, "You will have a good feast of honey, but you must be careful to close the door and fill up all the holes in the walls."

The leopard was told to drop the gourd on the floor of the hut in order to get the honey. He did exactly as he was told. He gathered his family in the house, closed the door, and filled up all the holes in the walls. Then when all was dark he dropped the gourd on the ground to get the honey. The gourd broke and out came a swarm of bees. The hare was listening outside. Presently the cries died down, then the hare went away thinking that the leopard and all his family were dead. The mother and the young leopards died, but the father leopard recovered from the stings of the bees.

The leopard said, "Whenever I find a hare I will kill him."

One day the leopard caught the hare who had given him the swarm of bees. Of course the hare was frightened, so he said, "I made a mistake, I thought that there was nothing but honey in the gourd."

The hare pleaded for his life promising to give the leopard some good oil to make his coat shine. "First of all you must let me drive a wooden peg into your head," said the hare.

The leopard allowed this, and, of course, died immediately.

## THE HARE IS PUNISHED

A young leopard and a young hare were tired of obeying their mothers, so they decided to kill them. The hare said, "Let us eat your mother first of all."

They did so. The hare pretended that he had killed his mother and buried her in the woods, but the truth was that the hare had

hidden his mother, hoping that the leopard would forget about the agreement they had made. The leopard was suspicious, so he searched the woods and at last found the hare and his mother in hiding. The leopard ate both of them.

#### THE BIRD AND THE BAT

The bird Choko met a rat with a long snout. The rat, whose name is Enganga, said, "Run from the drill," meaning his snout. The bird was afraid, so flew up into the branches of a tree.

One day the bird saw that the rat was asleep, so summoned courage to fly down and tap his nose with a stick. The bird saw that the nose was soft, so flew back to the tree calling out, "Brother rat said, 'Run from the drill, run from the drill,' but I smashed it and found that it was meat."

The bird's cry is expressed in Umbundu by the call "*Kota Enganga wa ndinga hati, tila eseka, tila eseka.*"

#### THE QUAIL AND THE ROOSTER

The quail found a large fat white grub under the bark of a tree. He said to the rooster, "You live with people who have fire, so go and cook this for me."

The rooster carried the grub to the village in his mouth. The people of the village liked these grubs, so they caught the rooster and took the grub from his beak.

The quail waited for a long time, then called, "Rooster, rooster, bring the grub."

The rooster replied, "The fools have eaten it."

#### THE STORY OF THE CRICKET

The cricket was very quiet; he did not talk too much or quarrel with other people. One day he invited people to dig in his field, and promised that he would give them some beer. The first helper to arrive was the rooster, who drank a pot of beer. While drinking the beer, the rooster looked out and saw the wild cat coming toward the cricket's home. The rooster was very much afraid of the wild cat, so hid under the bed. Presently the wild cat entered the house and received a pot of beer. But looking out he saw the dog coming that way, so hid under the bed.

The dog said to the cricket, "Did I see somebody as I came along the path?"

The cricket said that nobody had called. While the dog was drinking the gourd of beer he saw the hyena coming, and he was so afraid that he hid under the bed. Soon after the hyena had settled comfortably in the hut, a man carrying a gun approached the cricket's home. The hyena felt sure that the hunter would kill him so hid under the bed. All the animals were now crowded under the bed not daring to fight among themselves, because they were all afraid of the man.

For a long time the hunter sat drinking beer and talking to the cricket. The animals under the bed were quite safe because they kept quiet. Suddenly a cockroach fell from the roof to the floor of the hut. The rooster was so excited that he forgot that he was hiding. He dashed out from under the bed and gobbled up the cockroach. The wild cat then became excited and dashed out after the rooster. The dog followed the cat, and the hyena attacked the dog. There was a terrible noise as the animals fought in the middle of the floor. The cat killed the rooster. The dog killed the cat. The hyena killed the dog. The hunter shot the hyena, then went away. Presently a tortoise arrived. He was frightened when he saw the dead bodies of all these animals, so sent for the little hare. The hare dug up the cricket from the hole where he was hiding. The tortoise and the hare killed the cricket, because they said he had caused the death of all the other animals.

#### THE WATTLED CRANE (EPANDA) AND THE SPUR-WING GOOSE (ONJAVA)

These two birds agreed to lay their eggs together in one nest. Onjava is a clean bird who washes her eggs, but Epanda is a dirty bird whose eggs are never clean. The little ones of Epanda hatched out looking dirty and ugly, while the little ones of Onjava were pretty and clean.

One day the two birds went in different directions to find food for their young. Epanda watched Onjava out of sight, then returned to the nest and stole the pretty young ones. When Onjava returned with worms to feed her chicks she found only the young of Epanda, so began to cry, "Epanda, Epanda, Epanda, with your long neck and long beak, you have stolen my young ones."

Onjava set out to follow Epanda. The little ugly chicks of Epanda kept up with Onjava for a time then died because they were so tired. When, at last, Epanda was overtaken, she said to

Onjava, "You have killed my chicks by making them walk so far, I shall keep your children."

Then the great hornbill was called in as judge. He said that the chicks were to stay with Epanda. For a time the little birds did as the judge had said, but soon they returned to their mother, Onjava, because they were clean birds and Epanda was a dirty bird.

#### THE HARE (NDIMBA) AND THE LEMUR (EVOVO)

Evovo (the Great Galago) is somewhat like a lemur. It has gray bushy fur and a long fluffy tail.

One day Evovo addressed the hare, saying, "O comrade, what is the noise I am always hearing from the place where you have your house."

Ndimba answered, "My friend, have you never seen the people carry me in a hammock while they sing?"

"No, I never saw anything like that," responded Evovo.

Ndimba invited Evovo to the plains where they hid themselves, Ndimba in one place, Evovo in another. Presently the two hidden animals heard the sound of people singing, "We know where Ndimba is hidden."

Then the barking of dogs was heard, and the people called their dogs, shouting, "Haow! Haow!"

Ndimba said, "I hear them coming with my hammock."

Evovo replied excitedly, "Yes, yes, I can hear."

The dogs chased the two animals. Ndimba knew the paths across the plain and so escaped, but Evovo knew of no hiding place, so was killed.

#### THE FRUIT BAT AND THE SUN

The child of the sun was sick. The bat was a good *ocimbanda* (medicine-man), so the sun sent for him to cure his child. The bat arrived without delay, performed the cure, and returned home. The sun was very grateful at the time, but soon forgot the kindness of the bat. By and by the son of the bat fell ill with a sickness for which the sun was a clever *ocimbanda*.

The messengers from the bat arrived after the sun had risen above the horizon. The sun told them that he could not come to cure any one after he had started across the sky on his journey for the day.

"Come very early tomorrow," he said. Next morning the messengers were sent away again, because they were too late.

Sadly these messengers returned to the bat with their disappointing news, only to find that the young bat was dead.

The bat said, "I hate the sun and I will never look at him again." The bat made a vow that he would never again go out into the sunlight to find food.

This is the reason why the bat never flies by day. He hangs head downward in a dark place all day, so that he will not see the sun.

#### THE DOG AND THE LIZARD

The dog and the lizard met on the pounding rocks where a woman had left a little meal when she finished pounding her corn. When the dog began to lick up the meal the lizard said, "You ought to be ashamed to eat this. All the corn on the rocks belongs to me because you have people in the village who give you food."

The dog said that this was not true. "Come to the village with me and I will show you how the people treat me," continued the dog.

The two animals went to the village together, and the dog found a hiding place for the lizard in a fence near his home. When the dog entered the hut a woman picked up a stick and drove him out. Then the dog cried as he came running from the hut, "*Tala! tala! sa ci popele,*" meaning "See! see! Didn't I say so?"

Ever since that the lizard and the dog have been great friends who may be seen on the pounding rocks eating together.

#### THE JERBOA AND THE LEOPARD

This story which is told at Ngalangi is essentially the same as one related at Elende, but in the latter version the dog and the hyena are the actors.

The leopard hired the jerboa to act as nurse to her cubs. While the mother leopard was absent hunting for food, the jerboa decided to eat one of these fat little leopards.

Presently the mother leopard returned and said, "Bring out the children, I will feed them."

The jerboa brought out the cubs one by one, taking care to bring out the first one twice over. Next day when the mother leopard was away the jerboa ate another cub. Again the leopard asked for her little ones. The jerboa had been placed in charge of four cubs. As two were eaten, the jerboa had to bring out each of the two remaining cubs twice over in order to satisfy the mother leopard. On the third day the jerboa ate another little leopard. When the

mother leopard returned, the jerboa brought out the only cub four times. On the fourth day the jerboa ate the last of the cubs.

When the mother leopard came home the jerboa was terrified, so said, "The cubs are not very well, you must go in the room to feed them; I cannot bring them out." When the leopard had gone into the sleeping room the jerboa ran quickly into his hole in the ground.

---

These tales from my records were all told to me by Ngonga. It is true that some of the stories appear in the Umbundu reader "Olosapo Vioku Likisa Oku Tanga" (Kamundongo, 1914). But when this book was printed Ngonga was already well acquainted with all the stories therein, and many more. Most of the tales were, and are today, an integral part of the Umbundu language.

My own inquiries had the same result as those of Chatelain in revealing a preponderance of stories of animals. Yet W. C. Bell was able to collect several tales relating entirely to the adventures of human beings (*Jour. Amer. Folk-Lore*, XXXV, pp. 116-150). At times there is a didactic theme running through a tale, which emphasizes the value of courage, presence of mind, and perseverance. A sense of humor is shown in the conversations of animals and the tricks which the smaller creatures use to the discomfort of the larger animals.

Comparative study of stories told by the Ovimbundu with those from other parts of Africa opens up a field of research, especially in view of the long caravan journeys of the Ovimbundu. Chatelain narrates the Angolan story of the frog who boasted that he could ride the elephant, and contrived to do so by a clever ruse (*Jour. Amer. Folk-Lore*, VII, p. 62). The Nigerian story of the tortoise who fulfilled the same boast is told by A. B. Ellis (Yoruba-speaking Peoples of the Slave Coast, London, 1894, p. 265).

The Ovimbundu have the story of the tortoise who made a wager with the antelope respecting a race which they agreed to run. The tortoise won the wager by placing one of his brothers at the winning post. The Umbundu version is given in "Olosapo" (p. 53), and there is a Cameroon version.

The tug-of-war story which tells of a trick played against the hippopotamus and the elephant is known to the Ovimbundu. The story has a wide distribution with local variations. Sometimes the elephant and the hippopotamus are unwittingly made to pull

against one another by some small clever animal such as the monkey or the hare. In the version given by H. S. Stannus (*Harvard African Studies*, vol. III, p. 329) the hare perpetrates this ruse. The version given by Smith and Dale (*The Ila-speaking Peoples of Rhodesia*, vol. II, p. 377) makes the contestants a hippopotamus and a rhinoceros, but the hare again arranges the tug-of-war. E. Dayrell (*Folklore Stories from Southern Nigeria*, London, 1910, p. 104) gives another variant of the tug-of-war story, which states that one end of the rope was made fast to a palm tree. The hippopotamus was under water so he could not see the object against which he was pulling. He thought he was tugging against the tortoise as arranged.

Umbundu stories are humorous and didactic, while some indicate a process of rationalizing. An example of the latter kind is found in the story explaining why the bat flies at night. Dayrell (pp. 36, 51) gives two different versions of this rationalizing tale.

These folklore stories of the Ovimbundu give information respecting vocabulary, structure of the language, powers of observation, customs, and ideas of conduct.

I have found no stories which illustrate the grafting of elements from two different cultures. In some parts of Africa tales may be heard which contain blended elements from a Negro and a Semitic culture, as in Nigeria. But assimilation of features which were foreign to the story at its cultural origin does not occur in the tales given here, with the exception of the European story of the greedy dog, which is an importation.

The Ovimbundu were noted for their long caravan journeys, which were undertaken in territory occupied by tribes of the same linguistic family (Bantu), a fact which may account for the similarity of Umbundu and other Bantu versions of the same tales.

## IX. RELIGION

### SUPREME BEING

Suku is the name of the most important dead person mentioned by the Ovimbundu. Ngonga says that Suku made mountains, rivers, sky, and people. The name Suku is known all over the great territory inhabited by the Ovimbundu. I have seen at the *ombala* of Ngalangi a small house of meditation where the king retires accompanied by an old woman. This retirement for communion with spirits of the dead takes place in time of drought, and a gourd filled with water is always kept in the house. In another village of the Ngalangi region I photographed a house of meditation for the king who retires for communion with spirits whenever he is troubled (Plate LXXXIX, Fig. 1). The painted marks on the door are said to be an indication to spirits that this is the king's house of meditation, but there is no reason for saying that the king communes with Suku.

The evidence regarding Suku was supplemented at Ngalangi by two Ovimbundu boys who agreed that Suku was very important. They associated Suku with rain; but the word *suku* does not mean rain, water, or food; these are expressed by *ombela*, *ovava*, and *okulia*, respectively. I know of no meaning of the word *suku* which might assist in explaining the attributes of this respected spirit. Names of medicine-men are remembered and used but they are not associated with the name Suku. My informants at Ngalangi said that names of kings are sometimes coupled with the name Suku.

At Ngalangi an informant stated that in the beginning everything was water. A man dropped from above, caused land to appear, and began hunting. At the side of a stream he saw an animal that disappeared beneath the water. He was about to shoot when he saw that the animal was a person something like himself, yet different. He took the animal home, mated with it, and reared a family. This story is told also at Cileso, about two hundred miles from Ngalangi. At Ngalangi I was informed that the first being was a calf with human attributes, who walked about on the rocks leaving mixed tracks of an animal and human kind, which may be seen to this day.

### SURVIVAL AFTER DEATH

There are ideas of reincarnation. Two Bailundu boys said that the lion was considered to be a powerful old man. If a lion is found dead divination is practised to discover the cause of death. If a

lion visits a village an old man talks to it through the palisade. The conversation is carried on in a series of grunts, after which the lion goes away. One of my informants said that "lions and leopards are watchdogs for old men who have died." When one of these animals kills a domestic animal or a person, the assumption is that the predatory animal was sent by a deceased old man who requires a sacrifice. Ngonga of Elende said that "when a lion killed a man it was a sign that there was a bad spirit from the man's family within the lion." There is divination to find who requires a sacrifice, since some ancestor has been neglected. W. C. Bell relates an Umbundu tale of a woman who changed herself into a wild animal, but I was not able to ascertain that belief in transformation is held today (*Jour. Amer. Folk-Lore*, XXXV, p. 129).

I am unable to prove that the Ovimbundu have definite ideas of the nature of a future life, but they certainly think of survival after death, and have clear concepts of good and bad spirits who influence the fortunes of the living. There is no idea of punishment or reward, but a bad man has a bad ghost which can do evil things. Spirits will follow their relations on earth; moreover, they will come to the house of bows where their property is preserved.

A man returning from a hunt with trophies, or from the collection of honey, will leave some of these on a grave. There is no idea of spirits in rivers and trees, but the first tree felled for building the house of a man of importance must not be allowed to fall violently. This may imply a belief in a tree-spirit.

Spirits move at night only and mentioning the dead by name or whistling at night calls spirits. There are many instances of sacrifice connected with the idea of a spirit who has to be appeased. The medicine-man can induce a spirit to enter an image of wood. Thus there are wooden images containing spirits useful to the blacksmith. There is an image which can show travelers the right path when the medicine-man consults it (Plate XXI, Figs. 3, 5).

*Osande* is a good spirit who will "bring good luck and do good things for the people, while *Ondele* is a bad spirit who harms the people," said Ngonga. When a person is sick, mad, or dizzy he has *Ondele*. Only a powerful *ocimbanda* can cast out *Ondele*. *Ocilulu* is the general name for a disembodied spirit, either good or bad. An *Ekisi* is an *Osande*; apparently the terms are synonymous.

A spirit can die a second time. There is, for instance, an evil bird of the night whose name is *Esuvi*. This bird is able to catch a spirit in order to make it die a second death. A living person

suffers sickness or misfortune if an ancestral spirit dies a second death. A person who has bad health says, "The spirit of my grandfather has been caught by *Esuvi*." The name of the good spirit *Osande* is used by a person who is suffering. Such a one says, "I have no more *Osande*." These instances clearly reveal a belief in the dependence of human welfare on the interest of benevolent ancestral spirits.

After a lapse of three months I asked Ngonga again about *Osande* and *Ondele*. He confirmed what he had previously said, but spoke in the plural of these spirits; good spirits are called *Olosande*, bad spirits are called *Olondele*. The medicine-man will visit a hut to foretell the future, and while there he puts a concoction in an image to which he addresses questions. He plugs his nostrils, then in a falsetto voice feigns answers from the image. The father of a family, or possibly the mother's brother, may kill an animal in front of the hut on this occasion. He then says to *Olosande*, "We hope when we kill this there will be no more sickness." The Ovimbundu are afraid of death, and they therefore sacrifice to *Olosande*, asking that there shall be no death in the family.

I do not know whether the Ovimbundu distinguish multiple souls as some Negro tribes do. The part of a man which does not die is sometimes called *utima*, which is the word for heart. Dr. M. W. Ennis says that the *utima* and the *omuenyo* are both names of the spirit existing in a living body. Ngonga seems certain that every person irrespective of age, rank, and sex has a spirit, but I could find no evidence that the Ovimbundu visualize a separation of ranks or sexes after death. When a man kills himself he is buried near a river so that his spirit will go to the sea, and for the same reason a murdered man is buried near a river. At Ngalangi I inquired from other Ovimbundu people concerning suicide. Women who commit suicide generally do so by hanging or drowning. Men stab themselves in the heart or use a flintlock gun, the trigger of which they pull with their toes. It is feared that the spirit of a suicide will return to induce another suicide in the family, therefore there is anxiety to rid the community of these spirits.

#### RELIGIOUS BELIEFS AND CONDUCT

The Ovimbundu have many high standards of conduct, some of which have been mentioned in dealing with the education of children. There is, however, no idea of sin. That is to say, there are no commands laid down by some authority which is more than human.

Nevertheless, the idea of crime is well developed, and there are many actions which are punishable because they contravene the laws of the tribe. Adultery is a crime on a par with theft; but adultery is not a sin. Suku, the supreme being, issues no commands. Ancestral spirits are concerned only with sacrifice and homage to themselves. There is no theory of punishment or reward in a future life according to conduct on earth.

Perhaps *ekandu* is the only word which could express sin. An Ocimbundu would say that murder is the chief *ekandu*. "*Ekandu* is to make anything have a bad time." To send a stranger along the wrong path is *ekandu*. It would be *ekandu* to throw an animal on the fire. It is *ekandu* if a man is guilty of fornication with his wife's sister. Such an act is said to be *ekandu* only if the wife's sister is visiting the house of the culprit. The male defaulter is regarded as blameless, but the people of the village from which the wife's sister came would be expected to pay the wronged wife. Sexual offences against young children are very serious. In fact the death penalty or banishment would be inflicted, and such offences are given by the Ovimbundu as examples of *ekandu*.

This subject of moral responsibility leads naturally into the question of laws and penalties. There are among the Ovimbundu well-defined moral codes and clearly formulated tribal laws which have been described in chapter VI.

## FUNERAL RITES

### COMMONERS

In the village of Cilema in the district of Elende I witnessed the funeral rites of a boy aged twelve years. When a few hundred yards from the village, I heard sounds of drumming coming from a secluded place in the tall grass. On reaching the clearing four drummers were seen, each of whom held a tubular drum between his legs; these drums were of different lengths. The man on the left of the drumming squad played with an up and down movement of his left hand only, to provide the bass tone. Other drummers played with the palms and fingers of both hands. Thirty feet from the drummers stood a group of women who always started the rhythm for the drums by clapping their hands, and the hand-clapping continued as an accompaniment for the drums.

Near-by, men were seated on the ground, while a large number of women walked about or sat on the ground chatting and smoking their pipes. The general impression was not one of solemnity.

The interpretation of the chanting is "God has cheated me of a life." That is, God gave a life and he has taken it.

My interpreter, who was a relative of the deceased boy, explained to the people that I was seriously interested. This was necessary, as they were afraid of ridicule and hostile opinion. I sat down by the father of the dead boy and talked with him through my interpreter. In the meantime I observed that the corpse was in a cloth-covered box slung on a pole, which was supported on the shoulders of two men who stood very close to the drummers. The bearers remained immovable except for the occasional changing of the coffin pole from one shoulder to another. At intervals women came out from the group to dance near the coffin, one, two, or three at a time. One boy was particularly energetic in leaping in front of the corpse. When the performers had danced they returned to the crowd from which other persons immediately advanced. These detached and spontaneous performances each lasted about two minutes.

After two hours the bearers of the coffin moved away, followed on one side by some of the men, on the other side by a few women. A large number of men and women remained behind with the drummers. The music and the solo dancing continued. The corpse was removed to a place about a hundred yards from the spot where the initial ceremonies had been performed. The bearers still held the coffin on their shoulders, while men and women seated themselves on each side of the bier. This part of the proceeding was solemn and there was little conversation, though tobacco-smoking continued among both men and women (Plate XLV, Fig. 1).

A woman about forty-five years of age held a plate of corn meal in her hand while she stood close to the corpse and in line with the bier. She addressed the corpse very earnestly and paused intermittently for a reply. While speaking, the woman looked intently at the foremost of the bearers, who both stood immovable with their heads inclined forward and eyes directed to the ground.

My interpreter (Ngonga) said that the woman addressing the corpse was the oldest sister of the father of the dead boy, and that she was asking the spirit of the dead boy why he died. Here Ngonga threw a side light on family relationships.

The father of the dead boy was the son of Ngonga's mother's brother. The dead boy used to call Ngonga *tate* ("my father"); Ngonga called him *omolänge* ("my child"). When the woman had addressed the corpse an old man took her place. He held up the

plate of meal and earnestly asked questions. Lukuma was the name of the father of the dead boy. The old man who addressed the corpse was the brother of Lukuma's mother. Ngonga explained that the woman addresses the corpse, "to give him sense so that he will not be ashamed to tell all about it"; that is, about the manner of his death. The old man said to the corpse, "*Eitali* ['today'] *omolānge* ['my boy'] *tu yongola* ['we want'] *oku* ['you'] *tu* ['us'] *sanjuisa* ['make glad'] *o tu* ['to us'] *sapuila* ['tell'] *muele* ['indeed'] *cosi* ['all'] *ca* ['that'] *ku upa* ['you take'] *kilu lieve* ['from earth'].

The pause which followed a question was intended to give the corpse time to reply. It is supposed that if the answer is in the negative the spirit causes the pole to swing slightly backward. An affirmative answer is given if the spirit makes the pole swing forward. The old man demanded, "Is it witchcraft that hates us and killed you? If it is witchcraft, come to the front." I could see no swing of the corpse on the pole, but Ngonga said that he could see the coffin swing backward to indicate a negative answer. I suspected that the interrogator of the corpse gave a signal to the bearers, indicating that the coffin was to be made to swing, but I could see no signal or movement of the coffin. While the corpse was interrogated, males among the spectators spoke to the old man who was asking the questions. Ngonga explained that these men were suggesting questions which might be asked respecting the cause of death. A witness in the crowd would say, "You have forgotten this," or "You have forgotten that."

The next question was one that calls for a detailed explanation. *Sambulu* is a bad spirit which is able to cause death when crying women and children offend him by their wailing. The mother of the dead boy was a slave whose husband was absent from the village for a time. During this period the master of the woman threatened to sell her; consequently she went to a Christian mission with her children, one of whom was the boy now deceased. The woman and children were crying, hence the possibility that the evil *Sambulu* had at that time entered the person of the boy whose funeral rites were now in progress. The woman had visited the mission a year ago, but this lapse of time apparently made no difference to the possibility that *Sambulu* had entered one of the children. The spirit made a negative answer to this ingenious suggestion and eventually indicated that death was due to a "bad belly." If no answer is returned affirmatively, recourse is made to the medicine-man, who carries out divination. The details of this method are described

later in explaining the meaning of the articles which are contained in the divination basket.

I interrogated my interpreter respecting funeral customs, and from these inquiries elicited the following information. Burial of the corpse takes place a mile or more from the village in a grave dug by the father's sister's children. The depth of the grave is about six feet. Each village has its own burial ground. The woman who questioned the corpse carried a sleeping mat which would be used to spread on the bottom of the grave, though sometimes the mat is placed outside the grave on the mound of earth. Midway between Cuma and Caconda I photographed graves of the Ovimbundu (Plate XLVII, Figs. 1, 2). The articles on the graves were the poles used for carrying the coffin, a basket, broken gourds, and in one instance the horns of a bullock which was killed at the funeral feast. The horns were mounted at the top of an upright pole (Plate XLVI, Fig. 2). Ngonga said that the belongings of a well-to-do person would usually be broken and placed on the grave; the breaking is necessary in order to prevent theft. I could find no trace of the idea that property is broken so that its spirit will accompany the man to a world of spirits.

The corpse was in a wooden box covered with a thin piece of blue and white chequered cloth tightly wound about the coffin. Ngonga explained that the body was prepared in the following manner before it was placed in the coffin. The corpse was extended in a supine position with the thumbs tied, the palms together, and the hands on the pubes. The great toes were tied together and the upper arms were bound to the torso with bands of bark or cloth. The use of bark no doubt represents the older method.

At the funeral of a baby one of the grandmothers carries the dead child to the grave on her back. The ceremony of questioning the corpse is carried out if the child is old enough to walk and talk. Ngonga said, "If the dead child was old enough to talk they think he will say something." If the child was unable to talk, the parents, accompanied by their brothers and sisters, would visit the medicine-man to inquire the cause of death.

There are a few special observances connected with the burial of twins. When the children were alive the mother had to shake a rattle or to blow a small horn instead of giving the usual greetings to a passer-by, and this she has to do at the funeral of one or both of her twins.

A mourning widow must leave her hair loose and undressed, and she has to wear a cloth which conceals her from crown to sole. For three days she is obliged to sleep close to the corpse of her husband with only a stick between them. The stick, which is about the length of the bed, is laid between the widow and the corpse. During this time she has no food, and her wailing is expected to be almost continuous day and night. When the corpse is tied and prepared for burial the widow says farewell to it. Relatives support the corpse and make it advance toward her, while she herself is held in the position of a bound corpse, and is supported by relatives who make her confront the dead body of her husband. The widow does not go to the funeral.

Mourning continues after the funeral, with fasting and periodical wailing at three o'clock in the afternoon, and again twelve hours later. At the end of a month of mourning the widow lies for one night in the place where the corpse of her husband lay the night before burial. At the beer-drinking which marks the end of the period of mourning a medicine-man guides the hand of the widow as she dips a ladle into the beer pot and distributes the beverage.

The widow may stay with her mother's brother or she may return to her parents, but she must not become the wife of another man until a year has elapsed. The second husband will make a present to the widow's parents or others who have taken her, but this gift will not be as valuable as if the groom were taking a virgin.

Tree burial I have not seen, but heard of it near Ngalangi, and it has recently taken place at Gileso. Tree burial is the method for disposing of the corpse of a person who has died in debt. Any one who gives interment to a corpse assumes responsibility for the debts; hence tree burial is the most convenient way of disposal.

An Ocimbundu from Bailundu said that in that district the child is taken from the womb of a woman who has died pregnant. Food is placed on the lips of the removed foetus so that it will not induce the death of other pregnant women. Near Ngalangi a pregnant woman would be buried with the point of a long stick on her abdomen, and after the grave had been filled a blow would be given to the top of the stick.

The foregoing are the principal points of importance in the funeral rites of commoners. Ceremonies connected with the death and burial of medicine-men, kings, chiefs, and hunters require separate consideration.

## MEDICINE-MEN

When a medicine-man dies the people call in another medicine-man to take charge of the ceremonies. The corpse is tied in a sitting posture, which is the attitude for burial. His charms are attached to his body and in this position they remain in the grave. The head ornament *osala*, which may be feathers, quills of the porcupine, or hair from a goat's beard, is placed upright on the head and fastened by a band under the chin (Plate XXIII, Fig. 2). The corpse is kept in a seated position lashed to a stool for three days. There is no coffin.

The corpse is carried in the posture described to the grave which is dug at a cross-path. The corpse of a medicine-man is questioned in the same manner as that employed in interrogating the corpse of a commoner. When the corpse is placed in its grave the medicine-men, some of them from a distance, dance because they have "spirit in their heads." The medicine-men shake their heads while dancing, and without pausing each eats a living chicken that he carries in his hand. At the side of the grave, a dog, a chicken, and a goat are killed. No part of the flesh is buried; it is consumed by those present at the funeral.

A sleeping mat is placed in the grave, and on the mound of earth are placed horns filled with medicine, and skins which used to hang from the waist of the medicine-man when he was performing. The rain-making charms are not buried in the grave, because their interment would cause the rainfall to diminish; the charms may, however, be placed on the outside of the grave. No food is placed in or on the grave. The mound of earth is painted with a human male figure. When a new medicine-man is making medicine or performing ceremonies he uses the name of a deceased medicine-man.

It is thought that the dead medicine-man has spirits which he is able to send to earth. No images of the medicine-man are made. Medicine-men visit the grave at night in order to take parts of the corpse to include in their medicine. At Caconda in western Angola I obtained the outfit of a medicine-man who included in his equipment two small hoe blades which he used for disinterring the dead. There was a portion of human tibia in the basket and a round stone pounder for pulverizing bone along with other ingredients.

The funeral rites of a medicine-woman are the same as those of a medicine-man except that medicine-women carry the corpse. An *osoma* ("king") or a *sekulu* ("chief") will visit the grave of a medicine-man to ask for rain or other favors.

## KINGS AND CHIEFS

A chief (village headman) is buried in a specially constructed enclosure in the village over which he ruled (Plate XLV, Fig. 2). The mausoleum is a small hut with a substantial wooden door which is surrounded by a strongly built wooden fence ten feet high.

I was taken inside a tomb in the capital of Ngalangi, where the king showed the interior of his burial place of kings. There were four mounds of earth, each of which covered the body of a king, and a little distance away were the graves of the principal wives. The hut contained pottery and gourds; also a small fire, which is replenished by an attendant who must not allow it to be extinguished.

Ngonga says that the burial chamber at Elende contains the head of the chief in a box. After one year from the time of burial the box containing the head is opened in order that a libation of beer may be poured over it. Sometimes the head is anointed with palm oil and a new band of cloth is added. These attentions are paid to the head in time of sickness and drought. If the head shows signs of desiccation an ox is killed in order to provide a new piece of skin in which the head is sewn. The tomb is visited by men who come to ask for good fortune when they are departing for a journey to the interior, and these supplicants are led to the tomb by the ruling chief. Near the burial place of the *sekulu* ("village headman") at Elende there was the house of bows (Plate XLVI, Fig. 1), which is typical of several seen in different parts of Angola. These repositories always contain staffs, bows, arrows, sleeping mats, and possibly other articles which belonged to the dead.

The corpse of a king is suspended from the top of the burial hut by a rope which is tightly fastened round his neck. That the king has died is not admitted and the announcement states that "the king has a cold in his head." The head of a specially selected family twists the rope until the head is severed. The twisting is carried out gradually, a little each day, so that a week or more is required for severance. In former times the head was detached by twisting only, but at present a knife is used to hasten the friction of the rope. When the body of the king has fallen into the basket placed underneath to receive it, the people may say that the king is dead and mourning begins.

Judging by the arrangement seen at the *ombala* of Ngalangi the bodies are buried in a hut constructed as a burial place for kings, but Ngonga states that the older method was cave burial. The body

of a dead king would in former times be taken at night by chiefs and interred in one of the caves which are numerous in the rugged hills of the Benguela Highlands. The burial posture for a king is the same as that described for a medicine-man. The severed head is eventually kept in a box, but primarily both head and body are buried, though in separate places. At the end of a year the head is dug up and transferred to its casket.

Mourning for a king lasts for seven days, during which his children and wives wear strips of oxhide on their left wrists. The village chiefs gather to choose a king from the "blood of kings," though "sometimes a bad man will make himself king without waiting to be chosen." The choice should be in favor of the oldest son of the chief wife, "but if she has stupid sons, a son of another wife of the king will be chosen."

Sometimes during drought chiefs and their wives go to the grave of a chief where they say, "If you are angry tell us what you want. If you want an ox we will kill one." If they visit the tomb of a king, the king's corpse is asked, "Do you want a new box for your head? We will make one." The oldest chief takes from the tomb the box which contains the head. This is slung on a pole supported on the shoulders of two boys. The head is then questioned in the way described for the funeral of a commoner. The oldest chief offers a sacrifice, if such procedure is demanded by a forward swing of the pole which supports the casket containing the king's head.

The house is not burned after a death has occurred within, but it is still customary to take down the surrounding fence and to build a new one. The house in which death took place is then used as before. I was informed at the capital of Ngalangi, and by the king himself, that he must continue to use the house of former kings until the structure collapses. No repair work may be done; consequently the house was in a dilapidated condition. Some months after receiving this account at Elende I was in Moxico, several hundred miles away, and learned that at Cangamba the custom of severing the head of a king by suspension and friction prevails in the manner described above.

#### HUNTERS

While traveling in the district of Ganda, likewise in the Vasele country in the hinterland of Novo Redondo, one cannot fail to notice the presence of rock tombs (*ombilia* or *osonje*) which are mausoleums of hunters. These are invariably placed in commanding

positions on domes of rock. The first tomb examined was in Ganda (Plate LXXIV, Fig. 1). This tomb is carefully built up from pieces of granite detached from the rocks which serve as a base. Horns of animals are placed on the cairn which is further decorated by a stick bearing the tail of an animal. Plate XXXII, Fig. 1, shows a tomb of similar structure in the country of the Vasele. From one such tomb it was possible to detach a slab so that the interior could be seen. There were two male skeletons; one lay supine while the bones of the other were in disorder.

In a hunter's house of bows there are implements of deceased hunters, whose ceremonies centering in these relics have been described under the heading of hunting.

#### TRAINING OF MEDICINE-MEN

Training for the position of male or female magician (*ocimbanda*) is not carried out with formality ending in initiatory rites, neither is the position hereditary; but the boy or girl who wishes to become an *ocimbanda* must have "spirit in the head." This choice of children of peculiar neurotic temperament for the positions of medicine-men and medicine-women is widely distributed, as I have shown in some detail (Origins of Education, 1926, pp. 256-259).

Among the Ovimbundu there does not appear to be an intensifying of natural psychoses by seclusion, starvation, or beating. When a boy is sick, the medicine-man says, "You have a spirit who wants you to be *ocimbanda*." The medicine-man kills a dog, a goat, and four chickens, then the boy has to accompany his master, carrying his apparatus and obeying him in every way. The medicine-man says, "Your father was an *ocimbanda* and the spirit wants you." The female *ocimbanda* is called *cambula* by other women, and her services are preferred to those of the male *ocimbanda* in cases of difficult childbirth.

In Ngalangi I was informed that the Ovimbundu have great faith in the medicine-men of the Vangangella, a name vaguely applied by the Ovimbundu to several tribes of east-central Angola. An Ovimbundu will make a journey of several days in order to visit a distant medicine-man of another tribe.

#### FUNCTIONS OF MEDICINE-MEN

Magical practices are of two kinds, social and anti-social. The man who carries out divination, rain-making, healing the sick, and many other functions is *ocimbanda*, while the secret worker of evil, the witch or wizard, is *onganga*. In one village there may be several

men and women each of whom receives the name *ocimbanda*, and specialization in some particular form of magical practice is the rule. Some practitioners are more highly esteemed than others. For example, an *ocimbanda* who has the reputation for curing dizziness, madness, and *onyalai* (p. 281) is one of great repute; so also is the man who can cure a case of blood in the urine (*biliosa*). This is the Portuguese term commonly applied to blackwater fever.

#### DIVINATION

An examination of objects collected gives the best indication of the equipment of the *ocimbanda*, and among these no item is more important than the small divination basket containing a heterogeneous collection of objects.

A diviner receives the distinguishing title of *ocimbanda congomba*, and a description of his methods explains his belief in the activities of spirits. He shakes the basket while his assistant plays a small friction drum; then he inspects the objects lying at the top.

A figure with beads on its neck indicates that trouble is due to the ghost of a dead baby whose spirit wishes to come back.

A piece of gourd with a round orifice means that some one has been talking too much. The orifice represents a human mouth.

Two figures, male and female, whispering together, indicate that a husband and wife are making a plan to poison somebody.

The figure of a female with a large abdomen indicates that the spirit of a deceased pregnant woman is causing sickness in the village.

The horn with shells on it indicates that the woman who is consulting the diviner will not bear children.

There is a little figure with a black tuft on its head, whose arrival at the top of the basket indicates that misfortune among the natives is caused by Europeans. When talking to this figure the medicine-man tries to speak like a white man by adopting a falsetto voice and mimicking the intonation of Europeans.

The figure with a little crest on its head is an indication of sickness or other trouble arising from a spirit which likes to drink blood. When this figure comes to the top of the basket, the medicine-man induces the blood-drinking spirit to enter a man, because the evil must first be localized before it can be exorcised. This possessed person dances with a small ax or a hair switch in his hand. When dancing has induced a frenzy, the dancer kills a pig and drinks the fresh blood. The blood-drinking spirit is in this way exorcised from the community.

If the figure with united legs comes to the top of the basket the meaning is that a medicine-man used to be in the family of the consultant. The spirit of this medicine-man wishes some member of the family to become a medicine-man.

The little wooden snake signifies cords and binding. Dreaming of a snake indicates that the dreamer will be tied and sold into slavery. When the wooden snake comes to the top of the basket, the significance is that a spirit has tied the sick person who is consulting the diviner.

If the wooden figure of a girl appears at the top of the basket, the inference is that the spirit causing trouble is that of a girl.

The appearance of a thin wooden figure at the top of the basket means that the troublesome spirit is that of a person who died when away on a long and fatiguing journey. The afflicted person who is consulting *ocimbanda* has to make an offering to one of the wooden human figures which are to be found along trade routes.

The piece of iron in the basket may come to the top when the contents are shaken. When this happens it is assumed that a death will take place. The death is attributed to something, for example, alcohol, which has come from white people.

The piece of horn from the hoof of an ox indicates that a troublesome spirit desires an ox to be sacrificed. If a sick man is consulting the diviner, he is told to take a drink containing parings from the hoof of an ox.

The bone from a chicken's leg indicates that sickness has come from the road, that is, from a journey. The Ovimbundu have been famous for their long journeys across Africa, hence the implication seems to be that a disease of an infectious kind has been brought from a distance.

A corn cob indicates that trouble has arisen from a spirit which can affect the growth of corn if not appeased by sacrifice.

A coin indicates that the sick or deceased person was too fond of money; misfortune has come from the spirit who gives wealth and good luck, because it has been offended in some way.

There is in the basket a white bone which means that there will be laughter in the village.

The small cocoon of sticks, which I think belongs to a caddis fly, means that some one has stolen a bale of cloth.

Small round shells indicate that everything is well.

A small wooden boat indicates that some one will be drowned.

The handle of a hoe is the symbol of cultivation. The appearance of the miniature handle at the top of the basket implies that the spirit of a woman who was rich in corn is troubling the community.

Two united, human figures of wood indicate that a twin will die. The Ovimbundu welcome twins; when one is dead the mother has a wooden figure (Plate XXI, Fig. 1) made to take its place; this is nursed to induce another conception and to comfort the remaining child.

The little gourd means that a deceased person was secretly poisoned in revenge because of his thefts from a field.

The seed of the oil palm means that a large gourd of palm oil has been stolen.

The description of funeral rites gave an account of the questioning of the spirit of the deceased. If no answer is given, divination is made to learn the cause of death.

There is no divination by examination of entrails. Bones are thrown in playing a game, but this is not connected with divination.

#### EQUIPMENT AND MISCELLANEOUS DUTIES

The basket of an Ovimbundu medicine-man at Caconda contained, in addition to the human bone, pounder, and hoe blades already mentioned, two carved wooden female figures whose specific use is unknown. It is known, however, that such figures may be nursed and held to the breast of a woman who wishes to conceive. There was a cowrie shell on a cord which forms a charm to be worn round the neck of a woman who desires children. A small tin box containing a coin and some stones was used for shaking. The kind of sound produced, also any arrested movement of the objects in the box, are indications of the guilt of a person whose name was mentioned just as the objects ceased to move.

A large antelope horn, filled with a mixture of goat's fat and charcoal from the bones of a goat, was intended for use in curing the sick. The contents of the horn become liquid when heated; then they can be dropped on the heads of the people who come for treatment. It was explained that a number of sick people sat around the medicine-man who walked to each person and poured out a small quantity of medicine on the patient's head.

The only musical instruments used by a medicine-man are a small friction drum and a rattle. At Ngalandi I saw a medicine-man give a dance during which he slashed about him with a small ax, which was evidently a ceremonial object, since the construction

was too light to make it effective as a tool or weapon (Plate XIII, Fig. 4). At Bailundu I was informed that an ax of this kind is used in a medicine-man's dance which is intended to cure a man who is sick because a spirit has entered into him. The sickness may have occurred because the man has broken a promise.

The medicine-man, or sometimes the patient himself, dances violently, meanwhile cutting about him with the ax (*omutaka*), which is finally used for killing a little pig whose blood is drunk by the sick man. This is the ritual that was previously mentioned in describing divination.

The following are important ceremonial objects: The ax *ekuwa* (Plate XIII, Fig. 5) was the one used for killing slaves who were eaten at the death of a king. This object was secured in the Vasele country near Vila Nova de Selles. It is of handsome appearance, having a copper circle inlaid into the iron blade. A spear from Bailundu is likewise important because of its use in ritual (Plate XIII, Fig. 8). Before war and hunting this spear was thrust first into an ox then into a slave. The human and animal flesh were cooked together and eaten from the same pot. The female figure used by the medicine-man for consultation with regard to the correct path for a caravan has been described. A carved wooden post obtained from Bailundu was set up at cross-paths so that it might be visited by a sick person or his representative who would make sacrifice there.

Without parallel among ceremonial objects used by the Ovimbundu is a small wooden cloth-covered box from Bailundu. This contains a piece of root of cylindrical form tightly bound with cloth having at one end a cowrie shell. The box is the shrine of *Kandundu*, for whom a small hut is built in order to contain the box. Any one who sees the contents of the shrine is said to become blind. *Kandundu* is believed to be the "spirit of dreaming who makes swellings come on the body."

Antelope horns are in general use as containers of magical potions. One horn from Bailundu is used for holding sweet beer which is drunk by a person afflicted by bad dreams. A large horn with a piece of fur attached, also from Bailundu, is named *ocindiko*. The horn contains a mixture of fat and charcoal which is heated near camp after sunset, when men are on the march. The spreading fumes keep away lions and thieves. It was said that a thief is deterred because the fumes make him cough.

The charm *osonge* or *ombuiyu* is in the form of small neckbands of plaited fiber to which two or three cowrie shells are fastened. It is worn by women who wish to induce conception. A neckband of this kind which was worn by the maternal grandmother is thought to be specially effective. Sometimes a small rattle, formed from seed pods attached to a stick, is tied to the neckband. The rattle is shaken when the mother of twins meets a friend to whom she is not allowed to give the ordinary greeting.

A tortoise shell containing fat and charcoal is worn by the mother of a child who is afflicted by the spirit of *Kandundu*, which may cause the baby to have skin eruptions or a very small amount of hair. In order to cure her child, the mother must eat small quantities of the contents of the shell from time to time. In some sympathetic way the medicinal benefits are transferred to the infant.

When dancing, the medicine-man usually wears a goat's beard attached to a circular piece of basketry. This *osala* is sometimes fastened on the top of his head. In place of the ax already mentioned he may flourish a small ceremonial hoe or whisk, or a wooden baton with a tuft of hair at the end.

Among the varied duties of the medicine-man is that of washing the body of a king (*osoma*) or a chief (*sekulu*). To water in a pot, the medicine-man adds some of the blood of a freshly killed chicken. Then in a hut specially reserved for the purpose he performs the ceremonial ablution.

At Cangamba an Ocivokue performed a ceremony which was supposed to make a thief return to the village for trial. The medicine-man sat on his haunches, holding in one hand a small rattle and in the other a slender stick on which the decorated carapace of a tortoise was poised (Plate LXXXII, Fig. 1). Very earnestly the man talked, shook his head, and gazed at the tortoise shell which began to twist on its pivot. As the medicine-man muttered and shook his rattle, the movement of the shell grew faster. Presently the rotation of the tortoise shell was reversed, but so adroitly that I could not follow the movement or imitate it when allowed to try. The reversed movement of the carapace on its pivot represents the culprit turning back to his village.

#### CURING THE SICK

At Cangamba a female *ocimbanda* was seen painting marks of red and white on the face of a sick woman. The ceremony was called *ovihamba* and its object was said to be the relief of rheumatism,

of which there are several named varieties. Painting of women has previously been mentioned in describing ceremonies associated with pregnancy.

Several distinct performances for curing the sick were observed at Cangamba, which is a center of the Vachokue tribe, though a few people of the Ovimbundu and many Luchazi and Babunda mingle at this place.

In the first instance the sick woman knelt in front of a hut two feet high which contained a clay leopard marked with white spots. The medicine-man dipped a bunch of leaves in water and stroked this along the patient's spine from the neck to the sacrum.

The second performance was more elaborate, and detailed preparations were made outside the hut of the medicine-man (Plate LXXXIII, Fig. 2). A screen of posts and boughs was erected, and on one side of this two male drummers stood, each with a long tubular drum before him. On the other side of the fence were three wooden posts, each two feet high, circular in cross section, and painted, as indicated in the illustration. Near the posts was a basket, so closely woven that it contained water in which green twigs and leaves were soaking. The drums began to beat and a group of women clapped hands in rhythm.

The patient knelt before the small painted wooden posts close to the basket of water, into which she dipped her face from time to time. While the drum music and hand-clapping continued, the medicine-man took wet twigs from the basket. He drew these very slowly along the spine of the patient from neck to sacrum, as if painting with a brush. The patient occasionally shivered from head to foot; then remained still, except for the dipping of her face in the water, until the next paroxysm shook her. This routine continued for ten minutes. The medicine-man then knelt by the woman, dug a small hole in the ground, and pulled up one of the painted wooden posts which he placed in the patient's hands. The medicine-man kept his hands over those of the patient while she transferred the painted post to the new hole that he had prepared. Finally the basket containing the water and leaves was buried thirty feet from the scene of operations.

A similar ceremony was witnessed near this site. In this instance, however, the water was obtained from a boat-shaped receptacle mounted on two Y-shaped posts, at a height of three feet from the ground (Plate LXXXIII, Fig. 1). Outside the hut of the medicine-

man, and fastened to the wall, was a strip of bark cloth painted with white circles. These recorded the number of times the patient came for treatment.

At Ngalangi there was no difficulty in obtaining information respecting plants used medicinally. Each of three medicine-men returned with a number of roots and stems which they readily described. *Okakamba* and *okapelangalo* are roots that cure "big head." This disease, which is rare in white people, begins with blood blisters in the mouth; these may spread to the intestines and cause death. *Okayenje* is a root that induces vomiting; it is also a purgative to free a patient from worms. *Olutikitiki* is given to a woman soon after her baby is born. *Kalungdumona* is a plant having a purple flower. If the root is pounded and drunk in water it acts as an aperient. *Okumbiasoko*, when pounded and placed on the fire, restores a person after fainting; the head of the patient is held in the smoke. To a violent maniac the root *usonge* is given, pounded in water and mixed with maize beer. At Ngalangi a man who had been subject to homicidal mania was sitting on the ground quietly with his hands tied behind his back. I was informed that *usonge* was making him better. *Ocinyeni* is a bark that is chewed to remedy stomachache. *Kosamba* is a plant used to cure people who fall into the fire; it is also a remedy for toothache. The action of this drug *kosamba* causes vomiting and evacuation.

*Cilendaluka* is pounded in water and smeared on the patient's body as a treatment following the internal application of *kosamba*. *Mbundakataka* is a root that is pounded and applied externally to cure sores on the lips.

In addition to the plants just mentioned the following are important:

*Ocimbinga*. This plant, whose name means "the big horn," is probably *Strophanthus*. It is used in the treatment of worms and chest colds.

*Ocipumbulu*. This is a trailing herb whose leaves when pulverized are said to be a cure for bad sores.

*Ociindimbala* and *oluavava*. These are used to give to women who are suffering in difficult delivery. *Ongolo* sometimes takes the place of these drugs. The bark of *ongolo* is pounded in boiling water which is contained in a basin over which the woman sits. Use of the bark in this way is a protection against injuries resulting from childbirth.

*Omondolua*. This is good for headaches and whooping cough. The roots are boiled and mixed with sweet beer.

*Okalolula-lohala*. This is said to be used in cases of dysentery. At Elende it is used for curing skin diseases.

*Ohatle*. This is used in cases of snake bite, swellings, and stings.

In connection with the foregoing study of the native pharmacopoeia it will be of interest to consider some maladies to which the Ovimbundu

bundu are subject. Information relating to these points was given by Dr. Hollenbeck of the Mission Station at Elende.

Of intestinal worms there are many kinds. Hookworm is of somewhat common occurrence. Ascaris, an intestinal worm several inches long, is extremely common. Infection may arise from the soil, also from the use of dirty cooking utensils. The disease trichinosis, which arises from the activities of the parasite trichina, is rare. Tapeworm is frequent because much of the pork and beef is infected. Oxyuris, a small round worm about half an inch long, is common. Bilharzia is fairly prevalent.

Malaria is so usual that almost every one suffers at some period. Every baby has malaria within the first two years of its life. Malaria is not followed by blackwater fever, but possibly by *onyalai*, which is known at Elende. The symptoms are the appearance of blood-blisters on the tongue. These spread to the throat and intestines, possibly with fatal results. This disease, which does not attack white people, is local.

There is no sleeping sickness at Elende, but the disease occurs at Katombela, at some points on the Kwanza, also near the mouth of the Congo. There are at Elende cases of elephantiasis due to the activities of a filaria which affects the lymphatic glands. Infantile paralysis occurs.

Leprosy is fairly common; the nervous form is more usual than the nodular. There are instances of yaws, a disease somewhat resembling syphilis inasmuch as the disease is communicated by a spirochaete, but yaws is not communicated by sexual infection. Venereal disease is not common at Elende.

The pulmonary form of tuberculosis occurs, but is not usual at Elende. There are places in the Benguela Highlands where the disease is increasing. Both whooping cough and measles are well known, but there is no scarlet fever or diphtheria. Chickenpox and smallpox are both known to occur, the latter in epidemic form from time to time. There is occasional dysentery, but no typhoid.

Hernia in its inguinal form is common. Umbilical hernia, due to lack of skilled attention at birth, is frequent, but with advancing age this defect is often rectified, or at least greatly modified. There are cases of injury to women at childbirth; for example, vesical-vaginal fistula. Blindness is fairly common as a result of the neglect of inflammation of the conjunctiva. Babies suffer from corneal ulcers, which sometimes result in total blindness. Cataract is fairly common in both its senile and juvenile forms.

Deformities resulting from burns are frequent. Cooking pots are unstably placed on logs which form the fire, and, in addition to this, people sleep very near the fire. There is no cerebro-spinal fever. Pneumonia is very common; the result is often fatal. Weakness of the heart is only occasional. Varicose veins are rare. There is no appendicitis.

One cannot fail to notice the prevalence of tropical ulcers among the Ovimbundu. These occur most frequently on the tibia. The big sloughing ulcer makes a large hole which the native fills with clay and a pulp of leaves. Sometimes a bark is pounded to a pulp and used in this way. These ulcers are very obstinate even under skilled treatment. Often after the wound has been healed it will break out again when irritated by the slightest injury. Medical opinion is divided as to the cause of these ulcers. Jiggers are a cause of deformation of the toes, which sometimes fall off or have to be amputated. Cancer is not usual in people under sixty years of age. Superficial cancer is the most common form.

Water, even when procurable, is sparingly used by the Ovimbundu. The hands and face may receive a perfunctory wash each day, but the entire body seldom receives this attention.

Cupping was observed on two occasions, but I think the operations were performed by the mothers of the children concerned, and not by a medicine-man. The method of using the horns or gourds is illustrated (Plate LXXXVI, Fig. 1). After incisions had been made the cups were applied. The operator sucked the pointed end of the cup, so creating a vacuum, which was maintained by pushing forward with the tip of the tongue a small ball of wax. This wax filled the hole at the pointed end of the cupping horn. The people shown in the photograph are Vachokue, but the method is the same among the Ovimbundu.

At Elende there was a sweat bath in the form of a hole in the ground containing a heap of stones. The stones are heated in a fire, then cold water is thrown over them so that steam arises to the patient, who crouches above the hole covered with a blanket.

In the Vasele country, also among the Ovimbundu at Elende, I examined corporeal incisions other than tribal marks. The explanation was to the effect that the making of cuts cured pain (Plates XXIV, Fig. 3; LXXXVI, Fig. 2).

#### RAIN-MAKING

The rain-maker (*upuli*) is a medicine-man who has specialized in this function. The *upuli*, who was an Ocivokue of Ngongo, and

not an Ocimbundu, was dressed in only a skirt of cloth, and his equipment consisted of a reed whistle and a hair switch made from a cow's tail.

The dance was a slow revolution without any violent leaping. The man held his arms upward, fully extended, and went through the motions of drawing rain from above; then he made slow arm movements suggestive of spreading the rain all around. At times he stood quite still and gave a shrill whistle. The hair switch was constantly twirled and flourished.

#### POISON ORDEAL

Evidence presented in chapters VI and VII will show that the poison ordeal is a widely spread Negro trait, and that administration of the ordeal is connected with legal proceedings during which the poison cup is usually given to the suspects or litigants by a medicine-man.

This ordeal as practised among the Ovimbundu and other people of Angola is in conformity with the general Negro procedure. Ngonga thinks that the poison ordeal of the old type is still practised secretly. According to the old law the poison cup affected an innocent man by making him vomit, while the guilty person succumbed.

Ngonga states that a form of poison ordeal which exists today is as follows: The medicine-man holds out two potatoes, one of which is poisoned while the other is innocuous. The poisoned man does not die but he becomes so ill that he confesses his guilt. This use of potatoes has been fully described in connection with legal procedure (chapter VI).

The guilt or innocence of suspects is tested by giving poison to chickens brought to the medicine-man by the accused men. He whose chicken dies is the guilty person.

#### CEREMONIAL FIRE

New fire is made during epidemic sickness, at the accession of a king, and at the building of a new village. On such occasions the twirling method is employed. The fire made is called *ondaku*, which is the ordinary word for fire.

When an epidemic of sickness occurs the chief of the village takes a present of eight yards of cloth to the medicine-man and asks the cause of the visitation. The medicine-man replies, "Your fire is dirty and worn out, you must have new fire."

The village chief takes this news to the people, saying, "Tomorrow we must find a goat, a chicken, and a pig, so that we may kill them. Then we must make a new fire." The chief pays for these animals.

Next day the medicine-man starts a fire by the twirling method, and as soon as the fire has been kindled he kills a fowl whose blood is allowed to drop on the fire and the wood near-by. The sacrificial goat and pig are treated in the same way. Sometimes a boy who is learning to be a medicine-man kills these animals. Meat from each of the animals so sacrificed is cooked on this newly made fire, care being taken that each kind of meat is kept in a separate pot. There is no special pottery for this cooking. When the meat is cooked it is tasted by a girl from twelve to fourteen years of age who hands a portion to the chief, who distributes the meat among the village elders (*olosekulu*). The meat from the chicken, which must be fat, is the first to be distributed. A cock or a hen may be chosen, but if the latter is selected it must be *utenda*; that is to say, it must not have arrived at the egg-laying age.

Finally there is a distribution of meat among the villagers who have been present throughout the ceremony. The chief speaks, saying, "We wish good fortune to the new fire." Each person has to take the responsibility for quenching his own fire before the new one is ceremonially made. After the feast each father of a "restricted" family takes away a portion of the newly kindled fire.

There is sometimes a ceremonial purification of the village water supply. Water is carried in a block of wood from the nearest stream, and to this water a few drops of blood from the sacrificed animals are added. The idea involved throughout is the renewal of health by the furnishing of new, unadulterated supplies of fire and water.

At the inaugural ceremony of a new king a similar proceeding is followed. A chicken is killed for the purpose of supplying blood to sprinkle the new fire and on this occasion there is a ceremonial hunt. The king may or may not join the males of the hunting party; sometimes he sends a substitute.

A girl follows the king or his substitute carrying a basket (*ongalo*) in which round fruits from the tree *olosangu* are contained. Each of the fruits is wrapped round with the skin of the large lizard (*etatu*). The object of the hunt is to kill a male antelope, the duiker (*ombambi*), and a hare (*ondimba*) which may be male or female. The hare is not called *ondimba* on this occasion, but receives the name for elephant (*onjamba*).

The hare is not carried over the shoulder, but has a ceremonial conveyance slung on poles (*owanda*) which are supported on the shoulders of two or even four men.

Laying the evil of a village on a goat, which is then driven out to die, is an Umbundu custom. The scapegoat ceremony has a cleansing function similar in purpose to the rekindling of fire for the community. Cavazzi pictured and described the scapegoat ceremony in the seventeenth century, and Ngonga informed me that he saw the rite twenty years ago.

#### PROHIBITIONS AND OMENS

There is a taboo against killing *oka kuhu*, which is the yellow-backed duiker. When Ngonga was sick he was forbidden to eat the flesh of the duiker (*ombambi*); neither is this flesh to be eaten by people who suffer from dizziness. In former days women were not allowed to eat eggs. The flesh of sheep and goats is said to be indigestible for children between the ages of three and six years. The flesh of the lion, leopard, and hyena is forbidden as food for the king, but other people may eat it. The king is in fact forbidden to eat the flesh of any animal which has paws; neither may he eat flesh of the bush buck. A medicine-man must not eat flesh of a dog except before a ceremony for curing the sick. The taboo against dog's flesh applies also to the diet of a king.

A woman must not step over the legs of a male, neither must a man step over the legs of a woman; for to do so causes weakness of the knees. A man or woman may step over the legs of a child.

Omens are numerous. It is unfortunate to see a snake holding a frog, and the person who observes this should go to the medicine-man at once. When going to a village to be tried by the chief it is bad to meet some one who is carrying a bark rope, as this indicates binding and punishment. If a person who is setting out from home meets a woman carrying corn meal or any other white substance, he or she must take a little of the meal, whiten the face, and all will be well. A fly in the mouth is a good sign, because the fly knows where meat is to be obtained and is trying to lead the way.

A stranger visiting a village is pleased when a dog is the first animal to enter the guest house. Dogs are fed, so the entry of a dog is a sign that the visitor will receive food. On the contrary, the appearance of a goat is a bad omen, because goats are not fed; they pick up a frugal living as best they can. Other prohibitions and omens have been mentioned in discussing the pregnancy of women.

## X. CULTURE CONTACTS

The foregoing chapters have presented the main outlines of the tribal life of the Ovimbundu, with a brief reference to some factors in the cultures of Angolan tribes with whom the Ovimbundu are in close contact. But hitherto no attempt has been made to analyze the cultural contacts of the Ovimbundu outside Angola.

The data recorded indicate that the tribal life of the Ovimbundu is not an independent growth in the Benguela Highlands. We have, therefore, a problem involving a detailed study of surrounding cultures. The most important of these are located in the Congo basin, Rhodesia, and South West Africa, and for this reason the present chapter is divided into three sections, each of which deals with one of these areas which are all contiguous to Angola.

In analyzing these surrounding cultures for comparison with the tribal life of the Ovimbundu, the social patterns as a whole are considered, and no attempt is made to construct a theory of derivations based on what might be a few fortuitous resemblances arising through convergence. Our study is aided by a knowledge of historical contacts and geographical contiguity of the areas compared. Therefore the method is not open to the objections that have been made justly against an assumption of cultural relationships between two widely separated regions, in which only a few artifacts or institutions have an alleged resemblance.

Chapters X and XI are concerned with discussing the probable cultural relationships of the Ovimbundu, and a final chapter, "Cultural Processes," indicates the way in which historical events and geographical factors have contributed to the selection and welding of traits whose aggregate now constitutes the tribal life of the Ovimbundu.

### CONGO BASIN

An examination of the cultural traits of the Congo basin is of particular importance, because of the known historical connection of the Ovimbundu with Congo tribes, before the former entered the Benguela Highlands. Such a survey is conveniently made by examining the culture of the Congo basin from the estuary along the course of the main river, then southward along the Kasai and its tributaries into the northeast of Angola.

Despite minor differences the Congo area may be regarded as a region of considerable uniformity with regard to environment and

cultural factors. The transitions from the Congo basin to the Benguela Highlands are of a gradual kind with respect to climatic conditions, physical features, and culture. Therefore, there are no compelling conditions which caused the Ovimbundu suddenly to abandon traits already acquired before their southern migration.

Nevertheless, several traits of Congo culture which must have been known to the Ovimbundu have disappeared from their tribal life, while other factors have been emphasized in importance because of a change in locality. The disappearance of traits and the welding of others is discussed in chapter XII. The present section is concerned with summarizing the points of resemblance and difference between the Congo culture and that of the Ovimbundu.

The books of J. J. Monteiro mention several traits which are a link between cultures of the Congo and the Ovimbundu culture of the Benguela Highlands. The Mushicongos chip all their teeth to fine points (vol. I, p. 262), a practice which resembles that of the Umbundu-speaking Vasele. Monteiro describes the musical bow, the friction drum, and the rubbing of a grooved piece of wood with a stick (vol. I, pp. 139-141). All these musical devices are used today by the Ovimbundu far to the south of the areas described by this writer. When describing the Esole country which forms a cultural pocket of the Ovimbundu people, I have previously referred to Monteiro's mention of the extinguishing of old fires and the ceremonial creation of new ones at the death of a king (vol. II, p. 167); also the functioning of the poison ordeal with use of the bark of *Erythrophlaeum guineense* (vol. I, p. 61). The former of these customs is carefully observed by the Ovimbundu at the present time, while the latter is practised furtively.

A part of Angola that is frequently omitted is the Cabinda Enclave to the north of the Congo estuary. Overbergh describes this territory in "Les Mayombe"; the Mayombe are a forest people living near Boma. They use red *tukula* wood for bodily ornament. There are special names for the first- and second-born of twins (p. 217). Circumcision is practised (p. 233). The poison ordeal is used with the drug Kasa. There is a classificatory system of relationships (p. 259), but without sufficient detail for comparison with that of the Ovimbundu. The most artistic figurines, which are carved in wood or ivory, are sometimes filled with a mixture of clay and blood as "medicine" (p. 219). The Mayombe believe in the existence of a supreme being named Ngambi but they have no cult for him; there is, however, a very active belief in a world

of invisible spirits who work through apparitions, cries, and displacement of objects (p. 307). All these traits are features of Umbundu culture (see also "Etudes Bakongo," by R. P. J. van Wing).

J. H. Weeks (V) describes a number of traits which are typical of Ovimbundu culture. Mat-making by sewing long reeds together is pictured (p. 88) in such a way as to identify the method with that of the Ovimbundu. The Bakongo use a stick for making sounds by rubbing on notched bamboo (p. 179). The Bakongo have the dumb-bell basket-work rattle (p. 250), and the bull-roarer as a plaything (p. 126). The friction drum is used (p. 131). There are circumcision lodges for boys, also bachelors' clubs near San Salvador. The function of the bachelors' club corresponds with that of the *onjango*, the council house of the Ovimbundu. The graves of hunters are specially cared for (p. 181). The poison ordeal *nkasa* is carried out with an infusion made from the bark of a tree; vomiting indicates innocence. Nzambi, as among the Ovimbundu, is a vaguely conceived, powerful spirit who receives little attention; there are no prayers and no sacrifices in his honor (p. 276). Descent is reckoned on the mother's side. There is a kinship system of classified relationships; thus *ntekolo* means son's son, son's daughter, daughter's son, and daughter's daughter. *Nkaka* means mother's father, mother's mother, etc., in such a way as to show a parallel between *nkaka* and the *kukululu* class of the Ovimbundu.

R. E. Dennett has mentioned several ethnological points which serve further to connect the Congo culture with that of the Ovimbundu. Dennett's account deals with the Bavili, a branch of the Fjort of the Loango region to the north of the Congo estuary. The father and his brothers are *tata*, the grandchild class is *batekulu* (Umbundu *onekulu*); descent is matrilineal. A man must not marry the daughter of his father's brother or of his mother's sister, because such children are his brothers and sisters (p. 36). Girls are secluded at puberty in the "paint house," and the red coloring is beaten from them with switches (p. 38). The women I saw at Ngongo giving a demonstration of the decoration and dances of a secret society were elaborately painted from head to foot with alternate bands of red and white. The mother's brother may sell his sister's children to pay his debts (p. 41). Inheritance of property is in the female line, to the sons of the deceased man's sister. The heir to chieftainship is the eldest brother of the deceased, and the next in line of succession is a sister's son. The wife and children of the deceased are not entitled to any property (p. 46). The poison ordeal is given

with powdered bark administered by the medicine-man, and vomiting is a sign of innocence (p. 25). Nzambi, who is the supreme being from whom everything originated, corresponds to Suku and Kalunga of the Ovimbundu, for like these high beings he is remote and otiose.

When inquiring into the ethnology of the Kasai valley, situated to the northeast of the Benguela Highlands, a large body of literature is available. Each book or article confirms cultural resemblances between the social pattern of the Ovimbundu and that of the Congo basin, but not all points of comparison are to be found together in the works of one writer.

In an article on the "Ethnology of the South West Congo Free State" E. Torday and T. A. Joyce describe the use of manioc by the Bayanzi who scatter the flour on water, so making a paste. To eliminate the poisonous principle, bitter manioc is soaked in water for three days, after which it is peeled, dried, and pounded in wooden mortars (p. 138). *Tukula* wood, which is well known and widely used in Angola, yields a red powder that is employed for corporeal decoration by the Bapindi and the Bakuba (p. 147). The Vakuanyama of southern Angola use the powder mixed with fat as an unguent for their bodies and a dressing for leather clothing.

The evidence of Torday and Joyce shows that children of the Bakwese owe obedience to their maternal uncle; for example, boys who wished to accompany Torday had to ask permission from this relative (p. 150). The practice of cupping, use of friction drums and the marimba, are found among the Bakwese, who test the guilt of an accused person by giving a poisonous concoction prepared from the bark of *Erythrophlaeum guineense*; innocence is proved by vomiting.

Torday and Joyce (I) call attention to several traits which are common to the cultures of the Bambala and the Ovimbundu. Skin puncturing and the introducing of decayed rubber into the cuts are practised (p. 401); this is a common usage among Ovimbundu women. The poison ordeal is practised. Water-pipes for smoking tobacco are made from gourds. During agricultural operations hoe culture by women follows clearance of the ground by men. Women use a short iron-bladed hoe, and the result of their labor is the production of manioc, bananas, sweet potatoes, haricot beans, and peanuts (p. 405).

Rats are shot with blunt wooden arrows. There are great communal hunts for large game. The grass is fired, and at the conclusion

of the hunt horns and skulls are presented to the village fetish, a practice which is comparable to the mounting of skulls and horns outside the hut of an Umbundu hunter whose grave is later decorated with similar trophies.

Among the Bambala a hunter's bow is *buta* (Umbundu *uta*, "a weapon"). Exchange of blood seals an alliance between chiefs. Kinship is reckoned chiefly in the female line and children belong to the eldest maternal uncle. Widows never inherit property; this passes to the eldest son of the eldest sister. The word for father is *tata*. Personal names may be changed at puberty or later at the pleasure of the owner (pp. 410-412). Poison for the ordeal is made from the bark of a tree imported from the mouth of the Kwilu River (p. 416). The name for the soul is *mityima* ("the heart," Umbundu *utima*). In all these points the Ovimbundu resemble the Bambala.

Torday and Joyce have reported on the culture of the Bayaka (II). This tribe has the friction drum, but in a form rather different from that of Angola. The poison ordeal with the use of *Erythrophlaeum guineense* is employed. Straw shelters are built over graves which are covered with broken pots. Ovimbundu graves of this kind were photographed near Caconda (Plate XLVII, Figs. 1, 2).

The Basonge live near the Baluba close to the Lualaba River, and the report of C. van Overbergh has been consulted for information which shows cultural resemblances between the Basonge and the Ovimbundu. The Basonge use short ornamental clubs called by van Overbergh *batons de promenade*. Such clubs as these are one of the most artistic features in the wood-carving industry of the Ovimbundu. The clubs are too ornamental for use as missiles, and the name given by van Overbergh (plate I, fig. 13) is an appropriate description.

Hoe blades and the method of hafting are the same for the Basonge and the Ovimbundu. The wooden stools and gourd tobacco-pipes of the Basonge have forms well known to Umbundu wood-carvers. Manioc is the principal food of the Basonge (p. 125). Fire is made by twirling the point of a stick on a baseboard. Only rich chiefs have a few cattle, and the word for ox is *ngombe* (Umbundu *ongombe*).

I have examined the evidence of J. H. Weeks (III, IV) with regard to the Bangala (Im Bangala) of the southwest Congo region. The Bangala use the word *nganga* for "medicine-man," but for the Ovimbundu *nganga* is a witch, while *ocimbanda* is the legitimate

practitioner of healing and divination. If sickness visits a house of the Bangala the fire is extinguished and a new one is kindled. Women who have prepared a corpse for burial are purified by sitting in a circle of fires (p. 114).

Manioc, of which there are several varieties, is the principal food, and the methods of agriculture agree well with those followed by the Ovimbundu, since beans, yams, maize, and peanuts are cultivated. Caterpillars are used as food. Milk is tabooed by all Bangala, who regard it with great abhorrence, though no reason is given. The best hunters among the Bangala are specialists who are prepared for the hunt by the medicine-man (p. 123).

Fish are stupefied by poison of a vegetable kind which is scattered on the surface of the water (p. 127). The Bangala have the poison ordeal (p. 434). I have reported the use of the word *ekandu* by the Ovimbundu, who employ the term to denote any evil action which causes pain to others. If there is sickness in the family, the Baloki say, "There is an *ekandu* in the family" (Weeks, IV, p. 390), and the witch doctor removes this *ekandu* ceremonially.

The Baloki use painted wooden posts which are placed near the houses of the sick so that the spirits of sickness may be driven into them; the spirits are then appeased with offerings of food and drink. From Bailundu I obtained a carved wooden post in the form of a human figure; this was set on a path near a village so that offerings might be made to the spirit within the post if an epidemic attacked the village (cf. Weeks, p. 390).

The Umbundu game of shooting at a tuber has been described; apparently this amusement is like that of the Baloki game as described by Weeks (p. 405). Baloki youths cut the root of a plantain into the form of a wheel, and the players are then divided into two competing parties as among the Ovimbundu; but Baloki boys throw bamboo splinters at the wheel, they do not shoot arrows as do the Ovimbundu. Mancala is played (p. 414) as it is among the Ovimbundu, who call the game *ocela*; but I am not informed concerning the details of the game among the Baloki and Ovimbundu respectively.

H. von Weissmann (II) indicates that his route lay up the Congo to the junction with the Kasai. He then turned up the Kasai and traveled through the country of the Bambala, the Bassongo, and the Bakuba; thence along the valley of the Sankuru. He gives his impressions of the Bihéan (Ovimbundu) caravans from Bihé in

the Benguela Highlands (p. 145). "They carry on the most shameful trade imaginable and undertake longer journeys than any other Negroes of the west coast. They exchange their prisoners for ivory among the Bakuba tribes." Weissmann journeyed among the Wawemba of northern Rhodesia where he noted the poison ordeal. He states that it was customary to settle a dispute between two persons by drinking a poisonous draft made from a bark, and the one who vomits is cleared of suspicion. Weissmann's accounts emphasize the importance of Umbundu contacts through the caravan trade.

M. W. Hilton-Simpson, who accompanied Torday for a period, has noted several points of importance in the establishment of cultural resemblances between the Ovimbundu and tribes of the Kasai (pp. 225, 257, 259, 282). The Bambala play end-blown wooden flutes like those from Bailundu, but there is no evidence to show that the Ovimbundu play a nose flute as do the Bambala. The eating of dogs by the Bapende is a widely distributed cultural trait of the Congo, and the Ovimbundu follow this practice. Initiation masks pictured by Hilton-Simpson bear a resemblance to those of eastern Angola. The Batatela smoke hemp in a gourd water-pipe as do the Vachokue and some of the Ovimbundu. The short friction drum used by the Batatela is held under the arm. In the form of the drum and the method of holding there is resemblance to the Umbundu custom. The Batatela have the flat drum called *ocingufu* by the Ovimbundu (p. 52). Painting the exterior surfaces of walls of houses is a southern Congo custom followed by the Batatela. This practice has extended into Angola as far south as the Malange-Saurimo line, and even to the Bailundu-Huambo area, but south of the halfway line across Angola I do not recollect seeing houses with painted walls.

In dealing with the evidence of culture contacts indicated by the text and illustrations of the "Annales Musée du Congo Belge," a condensed statement will call attention to the many identities between artifacts of the Ovimbundu and those of the southwest Congo. The following details, which are well illustrated in the "Annales Musée du Congo Belge," should be compared with Plates IX-XXII, showing similar objects made by the Ovimbundu.

Series III, II, fasc. 1: Carved wooden staffs for chiefs closely resemble those used by chiefs among the Ovimbundu (p. 70).

Carved wooden hair-combs are like those used by the Ovimbundu and the Vachokue (p. 82).

Initiation of boys who are isolated in the bush where there is ceremonial bathing and circumcision is a practice of eastern Angola (p. 81).

The oval wooden masks worn by initiates are similar to those of eastern Angola (p. 84).

The mancala board with twenty-eight holes, arranged four by seven, is of the form used at Ngalangi, central Angola (p. 86).

The Babende use the friction drum (p. 87).

Bashilele arrowheads are of Umbundu pattern (p. 98).

Use of red *tukula* wood is common among the Bushongo (p. 165).

The wood-carving of the Bakongo and the Bashilele resembles that of the Ovimbundu. Faces are oval or triangular, and eyes are represented by narrow oval slits so as to conform in style and balance with the general outline of the face (p. 200).

Series III, II, fasc. 2, plates XXII, XXXI show reed mats made near Leopoldville. Such mats are made by Umbundu males, who call them *esaisa*.

The flat drum (*ocingufu* of the Ovimbundu) is played by the Batatela. The Bahuana use the long narrow-necked flour sifter which is in common use among the Vachokue, though not among the Ovimbundu (plate VIII).

Series III, I, fasc. 2, plate XLVIII, figs. 586-587; plate LIII, fig. 619; and III, plate XXXIII, fig. 470: The general style and pose of the figurines on these plates is exactly like the work of the Ovimbundu. Legs are short, knees are flexed, hands are clasped on the abdomen, and necks are elongated, while hair and cicatrization are clearly shown. All these figures are the same in form and function as those used by the Ovimbundu. Plate XXII, figs. 342, 354, 357, describes horns of antelope, also tortoise shells which are filled with medicine. The latter are provided with cords for suspension round the neck. Batatela war clubs are of the form used by the Ovimbundu (p. 65). These resemblances between work of the Ovimbundu and tribes of the southwest Congo is further shown by reference to illustrations by H. Clouzot and A. Level (*L'art nègre*, Paris, 1919).

Series III, I, fasc. 1: Mural decorations on houses resemble the designs on houses of northern Angola (p. 6).

The basket-work dumb-bell rattle is of the form used in eastern Angola (plate II, figs. 36-38).

Plate VI, figs. 123 A and B, indicates that the flat drum of the Ovimbundu is of the exact form used in the Kasai and Sankuru

region. Plate XVI, fig. 284, shows long wooden flutes like those of Umbundu pattern at Bailundu. Plate XIX, figs. 124 and 313, indicates that the musical bow with its gourd resonator is of the form used by the Ovimbundu.

The ethnographical catalogue of the Rijks Museum of Leiden shows many objects of the southwest Congo which are identical with those used by the Ovimbundu. Plate 193 pictures the *sansa* and the *marimba* which are common to both regions. Plates 224, fig. 1, and 225, fig. 1, show tobacco-pipes and a *mancala* board of Ngalangi pattern. The *mancala* board from the Sankuru region has twenty-eight holes arranged seven by four. Plates 75, fig. 10, and 236, fig. 4, indicate that curved knives used by the Bangala are like those used by the Vasele of northeast Angola. Plate 227, fig. 2, shows that head-dresses for initiates closely resemble those worn by Vachokue boys at Cangamba, eastern Angola.

This examination of the traits of Congo culture calls attention to numerous resemblances between the cultural pattern of the Congo region and that of the Ovimbundu of the present day. I think there is reason to accept the following factors of Umbundu life as a part of the Congo culture before the separation of the Umbundu-speaking peoples. The historical and geographical facts when considered in relation to the number of cultural identities fully support the thesis that the Ovimbundu are of the central African matrix of cultures.

On the material side resemblances are close, as the following summary will show. The Ovimbundu cultivate maize from which beer is made; they have manioc, peanuts, yams, sweet potatoes, and beans. Methods of agriculture and preparation of foods are similar. The animals common to both regions are the sheep, goat, chicken, and dog. The difference is the rearing of cattle by the Ovimbundu, who have also concentrated on the cultivation of maize to an extent not possible in the more densely wooded areas of the Congo basin. The use of dogs' flesh as food is common in both areas.

The musical instruments of the Ovimbundu are in keeping with Congo patterns in every way. Indeed, there exist few and only minor differences. Forms common to both areas are the *ocisanji*, a flat board with two rows of metal keys; dumb-bell basket rattles and gourd rattles; the friction drum; the *marimba*; wooden flutes; the flat drum *ocingufu*; the double iron gong; and the long tubular drum which is held between the performer's legs. Resemblances

of a definite kind are found in the game with rolling tubers; the use of red *tukula* wood for decorating the body; the insertion of burned rubber into scarifications; the gourd water-pipe for smoking tobacco and hemp; the dugout canoe; conical fishing baskets; and the use of narcotic poisons for fish. The wood-carving of the Ovimbundu is related not only in general style but in detail to that of the south-west Congo.

Close resemblances in points of social organization and religious belief exist, but some of these identities are common not merely to tribes of the Congo basin and the Benguela Highlands; they form traits of a wider cultural basis, as will be shown.

These resemblances have great weight in establishing relationship between a parent culture and the offshoot, because we are dealing with a large number of allied factors that have been welded into cultural patterns; the comparison does not depend on a few isolated resemblances of form. A point of identity in spiritual belief is the recognition of a supreme being, Suku, Nzambi, or Kalunga, a creator who is too far away to be concerned with the affairs of men. To him no sacrifice or appeal is made, since all attention is reserved for the ancestral spirits whose cult is connected with the use of wooden figurines, which are of similar pattern in the Congo basin and the Benguela Highlands.

The soul is said to reside in the heart, and the words used for soul are almost the same. There are houses for sacred objects once the property of men of importance. Distinction is usually made between the *nganga*, a practitioner of witchcraft of an antisocial kind, and the legitimate medicine-man. Both cultures have the rain-maker. *Ekandu* is a word describing any action contrary to the moral standards.

As a social factor there is the men's house where only males congregate for the evening meal brought by their women, and here the communal pipe is passed round. Government is the same, by kings of great power who delegate local affairs to village chiefs. The social structure of the Ovimbundu rested formerly on a system of alliances, warfare, and slavery similar to that of the Congo. A classificatory system of relationships and descent of property, not to a wife and children but to the maternal uncle or to children of the deceased man's sister, is similar for tribes of the Congo and the Ovimbundu.

The prenuptial relationship of boys and girls, freedom of choice in marriage, and the giving of marriage tokens are of the same

pattern. In principle, the puberty rites for boys and girls of eastern Angola are the same as those of the Congo region, and masks of eastern Angola resemble those used by the Bapindi of the south-west Congo. Cannibalism was a factor common to the Congo basin and the territory occupied by the Ovimbundu, who have practised ceremonial cannibalism within the memory of persons still alive.

The foregoing summary, supported by preceding details, makes clear that a substantial part of Umbundu culture is definitely like that of the Congo basin. There can be no objection to the evidence as a possibly fortuitous series of vague resemblances, since the entire backgrounds are of the same pattern. The Ovimbundu have a tribal life which is demonstrably a part of the matrix from which, on historical grounds, it is thought to have been derived. The loss of elements, the stressing of others, and the welding of traits from different sources, are matters for discussion in a final chapter dealing with the processes of cultural growth.

#### RHODESIA

A constant factor in the economic and cultural development of the Ovimbundu has been the caravan trade from Bihé and Bailundu northeastward across Africa to the Great Lakes, and southward across Moxico into the Zambezi valley and Rhodesia. Every traveler from Battell (1600) onward mentions these caravans which returned to the Benguela Highlands with slaves and ivory. The traditions of journeys still live. Umbundu words are used to describe the Great Lakes, and I have mentioned a wooden figure used for consultation by the medicine-man at a division of routes. There are even today a few large caravans.

The first regular slave traders into northern Rhodesia were the Mbundus from Angola. The Lambas say they were peaceful traders who brought calico, guns, and beads to trade for ivory and slaves. The Mbundu traders were often treated treacherously by both the Lambas and the Lenjes. In some cases they were robbed by the Lamba chiefs. It is said that the Lenjes used to bring their own children to the Mbundu traders in order to buy calico and powder. In the evening the Lenjes used the newly acquired guns to attack the Mbundu traders so that they might recover the children who had been traded (C. M. Doke, p. 79).

The account of F. S. Arnot is a valuable record of a journey which brought him into touch with these traders' caravans, whose route he followed into Garenganze, a country to the southwest of

Lake Moero, close to the territory occupied by the Barotse. With his Bihéan carriers Arnot passed along the valley of the Kwando (Livingstone's Chobe). He notes the use of bark cloth (p. 101) and gives an excellent description of the divination basket. "For divining they have a basket filled with bones, teeth, finger nails, seeds, stones, and such articles which are rattled by the diviner till the spirit comes and speaks to him by the movement of these things" (pp. 106, 116). The *onganga* or witch doctor is described on page 115; he is a person not to be confused with the *ocimbanda* or legitimate medicine-man.

Arnot saw a corpse tied to a pole supported on the shoulders of several men. "The witch-doctors demanded of the dead man the cause of his death, whether by poison or by witchcraft, and if by the latter, who was the witch? The jerking of the bier is taken as the dead man's answer." This is the ceremony I described at Elende about three hundred miles from the place mentioned by Arnot. "When a chief dies they say he is sick or asleep [p. 117], and an oxhide from a beast killed at the funeral should be buried with the chief's remains." Arnot was not quite correct; the body of the chief is sewn in the hide. "The people of Bihé say that there is a great spirit Suku over and above all, but they do not know him—I cannot say they believe him to be a universal god" (p. 119).

These instances recorded half a century ago are particularly interesting because of their agreement with present-day procedure. Arnot's description of the Vachokue country and the preparation of beeswax, also the method of extracting honey from hives lodged in trees (p. 146), would serve as a present-day record.

Arnot's information concerns the Garenganze country bordering on Katanga, a copper-producing region near the Lualaba River. Here traders from Uganda, Unyamwezi, the Luba country, the basin of the Zambezi, Bihé, Nyasa, and Zanzibar, gathered to carry on their trade in copper, salt, ivory, slaves, flintlock guns, powder, cloth, and beads. Apart from the evidence of any other writer, that of Arnot alone would suffice to prove the importance of cultural contacts of the Ovimbundu through caravan trade.

One would be mistaken in supposing that the Bihéans made occasional contacts only. For three centuries there has been this to-and-fro movement between the Benguela Highlands and central Africa. In Garenganze, about eight hundred miles from the centers of my research, Arnot noted several points that have been recorded in my notes. The word for medicine-man is *ocimbanda* (p. 242).

The vertebrae of serpents strung together as a girdle are a cure for rheumatism (p. 237). A necklace of pythons' vertebrae was obtained from a chief of Ngalangi who wore the bones to cure that affliction. In Garenganze twins were introduced to the chief at a ceremony conducted by a female *ocimbanda*. The Ovimbundu welcome twins and one of triplets is given to the king.

E. Holub (II) mentions important traits of culture among the Marutse, a Rhodesian people who keep cattle. The Marutse have an aptitude for working in iron, horn, wood, bone, and leather. The masked dance at which performers wore tightly fitting jackets of netted fiber, with close-fitting sleeves, gloves, and stockings of the same material, would serve as a description of the costumes worn in the ceremonies observed at Cangamba in eastern Angola. Holub notes the use of the double iron gong at these dances (vol. II, pp. 168-170). The bark receptacle (p. 308) is the one commonly used in eastern Angola, and along the line from Saurimo to Malange.

The Marutse have the poison ordeal in which vomiting is a sign of innocence, the witness being the god Nyambe (p. 322). Gourd decorations of the Marutse and Babunda tribes show a technique comparable with work of this kind done by the Ovimbundu (pp. 305, 335). The practice of cupping is described by Holub (p. 325); so also is the custom of wearing wooden hair-combs (p. 349). These are cultural traits of the Vachokue and the Ovimbundu.

In his "Eine Kulturskizze des Marutse-Mambunda Reiches" Holub gives a few additional points which connect the Marutse culture with that of eastern and central Angola. The main instances are the technique in gourds (p. 81); the form and hafting of axes (p. 116); blacksmith's bellows and tongs (p. 129); the musical bow (p. 139); the board with metal keys (p. 138); the small friction drum, identical in pattern with my specimen from Elende (p. 140, fig. 70); a musical instrument consisting of a notched board which is rubbed with a stick (p. 142); tobacco-pipes made from the horns of animals and from gourds (p. 147); cylindrical snuff boxes and sticks for pounding snuff (p. 150, fig. 83); wooden hair-combs (p. 155, fig. 87); and wooden stools (p. 163, fig. 92).

All these articles, which are pictured by Holub as being representative of the work of the Marutse of Rhodesia, have their exact parallels in Field Museum collections from the Ovimbundu.

Perusal of "The New Africa" by Schulz and Hammar was not ethnologically fruitful except for a series of outline drawings

(p. 110) showing forms of arrowheads used along the course of the Chobe River, near the southeast border of Angola. One of the heads is of the form most common among the Ovimbundu, while the remainder are those in use among the Vachokue. Gourds are of the same shapes and decorations as those obtained from Bailundu by Field Museum expedition.

F. H. Melland describes the culture of the Bakonde of northern Rhodesia. He is particularly concerned with the Kasempa district bordering on eastern Angola, Katanga, and the Barotse country. The poison ordeal (p. 222) is in use; vomiting implies innocence. The small ceremonial ax is used by the Bakonde in divination rites such as I have described for the Ovimbundu at Bailundu and Ngalangi (p. 227). The Lunda people wear masks in connection with initiation ceremonies (p. 232). Medicines are mixed in the horns of the duiker and the bush buck (p. 232). The four-legged, skin-topped stool is the same as that made by the Ovimbundu (p. 280).

Melland's description (p. 235) of a rite performed by a belated Konde traveler in order to retard the setting of the sun, should be mentioned. The top of a small ant heap is stuck into the fork of a tree; this is the custom which prevails among the Ovimbundu of Elende, and it is also a Lamba practice (C. M. Doke, p. 288). The idea is unusual and I suggest that the Rhodesian rite may have been derived from the practice of Umbundu carriers. Yet, on the contrary, men of the Bihéan caravans may have imitated a Rhodesian custom; but the act is so peculiar that independent origin seems improbable.

H. S. Stannus mentions points which aid the working out of a scheme of culture contacts. Stannus describes the Wayao and other tribes near Lake Nyasa, which was an area familiar to caravans from the Benguela Highlands. The carving of wooden animals (p. 348) of no known significance is a favorite pastime in which the Ovimbundu are skilled. Gourd vessels ornamented with lines and triangles (p. 349) have a technique similar to that used by the Ovimbundu. The shooting of arrows having blunt wooden heads; preparing staked pits; use of mucilage for catching birds; poisoning fish; and making noose traps (p. 355), are all everyday usages among the Ovimbundu, as they are among the Wayao.

Eastern and east-central Angola are the regions where bark cloth is made and worn. The Angolan industry forms an extension of the craft as practised in Rhodesia and the southwest Congo basin. Stages of stripping bark from the tree and soaking and beating it

with a wooden mallet are the same over a large area, but there are no painted patterns or other fine points of technique which aid the study of possible diffusions (Stannus, p. 343).

The following traits mentioned by Stannus have been recorded among the Ovimbundu. There exists the custom of opening graves to obtain portions of human remains for use as charms (p. 293); the poison ordeal is applied to human beings or to fowls (p. 296); the use of horns stuffed with medicine is common (p. 304); and divination by means of the small objects contained in a gourd resembles the method of the Umbundu diviner (p. 302). Stannus states that the gourd contains a number of small articles, each of which is named. In the divination gourd are small pieces of white earthenware which denote innocence, also bits of fiber from a sleeping mat to denote sickness. The Ovimbundu use a divination basket, not a gourd, for these symbolic objects, but otherwise the methods are the same.

The bark canoe and the dugout are used. Maize, cassava, beans, and peanuts are the principal crops (p. 346). There is ancestor worship combined with great fear of ghosts. The head of a family petitions a deceased relative, and the headman of a village intercedes with his predecessor's ghost. I have mentioned that a headman of the Ovimbundu brings out the head of a dead chief wrapped in oxhide, makes sacrifice, and asks favors. Stannus notes the seclusion and circumcision of boys at puberty, also the ceremonial use of bark cloth in these rites (p. 256). These observations from Nyasaland agree with notes made at Cangamba in eastern Angola. A menstruating woman sleeps on a mat away from her husband, and she is not allowed to prepare food (p. 234). These were noted as prohibitions for women of the Ovimbundu.

The classificatory system of relationship outlined by Stannus for the Nyasa region is the same as that of the Ovimbundu of Angola. A man may not marry a daughter of his mother's sister, but marriage with a daughter of his father's brother is a normal union (p. 236). The statement of Stannus (p. 239) with regard to the burial of a pregnant woman recalls the custom which prevailed until recent times at Ngalandi, where a sharp stake projecting from the surface soil rested on the abdomen of the dead woman. After the grave had been filled the stake was driven downward. Stannus says that before filling in the earth one of the gravediggers descends into the pit, and, after cutting the abdomen, he inserts the lower end of a bamboo, while the upper end is made to project above the surface of the grave. In Nyasaland and eastern Angola the alleged reason

for this procedure is the prevention of death among other pregnant women. Twins are welcome and well treated (p. 239).

A corpse is tied to a pole with its limbs bound, and in this manner it is carried to the grave, accompanied by drummers. A widow watches by the corpse of her husband. At the conclusion of funeral rites fires are extinguished, and a new fire is kindled with the fire drill in the chief's house, from which distribution of the new fire is made. The ashes of the old fires, with the stones supporting the cooking pots, are taken to cross-paths and destroyed.

Cupping is practised (p. 289), and the vapor bath is used (p. 290). The patient, covered with a blanket, squats over a pot of water into which herbs have been dropped. Hot stones are added to the water until it boils and gives off clouds of steam. Wayao boys have the whipping top (p. 359); so also have the Ovimbundu. The Wayao warm their drums and add wax to alter the tone (p. 365). The conical rat trap of plaited cane, used for placing in grass which is fired, is that in use by the Ovimbundu (Stannus, plate XX).

When describing the Wayao culture, C. H. Stigand confirms many of the points mentioned by Stannus. Stigand describes the making of bark cloth (p. 119); the sewing of reed mats with a long needle (p. 120); and the importance of the maternal uncle, whose consent to the marriage of his sister's children is necessary (p. 122).

C. Gouldsbury and H. Sheane describe the poison ordeal (p. 61). The Wawemba make their poison from the bark of *Erythrophlaeum guineense*, the tree mentioned so frequently in my summary of the Congo culture, in which this trait of the poison ordeal is common. A chief of the Wawemba goes to the bush accompanied by a medicine-man who is stripped of all clothing, and an offering of white beads is made to the tree from which the bark is taken. The bark is then given into the hands of a young child, who is carried to the village so that his feet may not touch the ground. As usual in this ordeal, vomiting is a sign of innocence.

The Wawemba practise cupping (p. 134). A man may not marry the daughter of his mother's sister because she is his sister (p. 172). The Wawemba carry a corpse on a pole. The king's corpse is wrapped in oxhide, and his bows, arrows, and spears are placed in a hut on the grave. Then an ox is killed to provide hide for binding the rafters of this tomb. Wives and slaves were formerly sacrificed at the death of a king. These customs are similar to those described for the funeral rites of a king of the Ovimbundu.

E. W. Smith and A. M. Dale describe tribes which claim that they are an offshoot from the eastern Bantu. This ancestry no doubt accounts for the presence of many traits which are characteristic of the culture pattern of the cattle-keeping areas of east Africa. The writing of Smith and Dale is important because it deals with a region in contact with the Congo, east Africa, and the Ovimbundu. The Wawemba and other tribes described by these authors are in contact with the Baluba and the Bambala, who have been in touch with the Ovimbundu from the earliest times for which any record exists.

According to Smith and Dale the tribes grouped as Ila-speaking peoples extinguish all fires after a funeral, while ashes from mourners' fires are collected and thrown away (vol. II, p. 142). This regard for ceremonial fire accompanies factors of the cattle culture wherever that occurs in east, south, southwest Africa, and the Benguela Highlands. The Ila-speaking people grow maize and beans (vol. I, p. 137); they smoke hemp through the calabash water-pipe (vol. I, p. 152); a conical basket fish-trap of Umbundu pattern is used (vol. I, p. 163); they peg out hides and scrape them; they also make twine by rolling fiber on the inner side of the thigh (vol. I, p. 185). Coiled basketry in which the coils are made of many strands of fine grass, also shallow winnowing trays, are like those used by the Ovimbundu (vol. I, p. 187).

Pottery is made by the coiling method (vol. I, p. 192). The method of carving stools bears a distinct resemblance to that of the Ovimbundu. The bases of milk vessels and stools show supports of peculiar shape which are triangular in cross section (vol. I, pp. 199-202). The Ila-speaking people have a classificatory system of relationships consisting of groups of grandparents, fathers, and mothers. Terms of address vary according to the relative ages of the speaker and the person addressed. *Wangu* ("older") is the term used by the Ovimbundu; so also is *tata* ("father"). Children of the father's brothers, and children of the mother's sisters, that is, ortho-cousins, are real brothers and sisters. The mother's eldest brother is the most important relative. The word *tata* is applied to all the brothers of the speaker's father. This is the system of the Ovimbundu in principle and considerable detail.

The Ba-ila play mancala (*chisolo*) with holes in the ground (vol. II, p. 233). They have the musical bow (vol. II, p. 263) and the metal-keyed musical instrument (Umbundu *ocisanji*) which is played in a gourd (vol. II, p. 265). The Ba-ila use the friction drum

(vol. II, p. 265), which is an instrument of the Ovimbundu and several tribes of the southwest Congo. The marimba, made from eight slats of wood with gourds underneath, is well known in the north and east of Angola.

There is real similarity both in form and function between the culture of Rhodesia and that of the Ovimbundu. This assertion does not rest on consideration of a few factors of a general kind. In addition to the weight of evidence afforded by the long list of similar factors detailed in this section, one must bear in mind the geographical proximity and the known historical connection of the areas under discussion. The following points are of primary importance in accounting for the similarity of culture patterns in Rhodesia and the highlands of Angola occupied by the Ovimbundu.

(1) Central Angola and Rhodesia have so many traits in common with each other and with the southwest Congo culture that together the three form a cultural harmony.

(2) Central Angola and Rhodesia have both derived factors from the cattle culture of east Africa, though by different routes.

(3) Rhodesia and central Angola have had prolonged direct contacts through caravan trade carried on by the Ovimbundu.

(4) In addition to diffusion there has been a convergence of cultures in Rhodesia and central Angola because of similarity of geographical conditions. Both are high plateau regions having a degree of heat and a rainfall suitable for the growth of maize and the rearing of cattle. Therefore these occupations have developed in both regions because in each locality there has been a need, favorable conditions, and a like response to physical conditions.

#### SOUTH WEST AFRICA

The principal tribes of this area are the Ovambo, Herero, Berg Damara, Nama Hottentots, and Bushmen. The most important tribes to consider from the cultural point of view are the Ovambo and the Herero. Wandering bands of Bushmen occur in Angola, and here and there may be seen among the Ovimbundu individuals who appear to have a trace of Bushman blood; but comparison of collections and notes relating to the Ovimbundu with literature on Bushman tribes does not reveal any similarities. There has undeniably been some contact of Bushmen with the inhabitants of Angola, but Bushman influence has probably been very slight from a cultural and physical point of view (D. Bleek; S. Marquardsen, p. 109).

The Ovambo include eight kindred tribes, all of whom are branches of the Bantu linguistic family to which the Ovimbundu belong. The Vakuanyama, who inhabit large tracts of southern Angola, are a numerous, warlike, pastoral branch of the Ovambo. The Vakuanyama are the only section of the cattle-keeping peoples of the southwest of Africa with whom I have made personal contact; but their culture is generally representative of that of the Ovambo and the Herero.

When making a journey southward from the country of the Ovimbundu in central Angola, there is a noticeable increase in the size of the kraals as the journey is continued. The first large kraal was observed near Kipungo, and when as far south as Mongua the wealthy cattle-keeping Vakuanyama were by far the most numerous people. Their total strength is probably about 55,000. I journeyed through the Kuanyama country in July, halfway through the dry season, but found that cattle were watered at deep wells from which men and women were constantly drawing water for the herds. Near Ondjiva, only a few miles from British South West Africa, the ruler of the Vakuanyama owned at that time 14,000 head of cattle.

After examining 1,200 objects collected in Angola, I feel sure that cultural contact between the Ovimbundu and the Vakuanyama is unimportant, so far as artifacts are concerned; but, if the inquiry turns to other aspects of culture, there is a more fruitful line of investigation.

Many beliefs and customs center in the keeping of cattle in east and south Africa. The typical cattle-keeping area begins with the Bahima in the vicinity of Lake Victoria Nyanza. The region extends down the eastern side of the continent, through the south and southwest into Damaraland. The Vakuanyama of southern Angola should be included in this area, which has homologies in respect to certain laws, ceremonies, economic customs, and religious beliefs.

The true pastoral area of the south of Angola extends at least as far north as Huila, where there is sufficient rainfall to produce good pasture in open country which is well adapted for raising stock. All the traditions of the Ovimbundu, along with the writings of Battell, suggest this southwest part of Angola as the line of entry for cattle. The Congo basin is not a pastoral country, and transportation of cattle from Rhodesia would necessitate the crossing of hundreds of miles of arid country in Moxico, eastern Angola. There remains, therefore, the cattle-keeping area of south and southwest

Angola as the source of supply for the Ovimbundu, who both traded and made warfare with the south.

Therefore, reasonable ground exists for believing that the cultural traits that the Ovimbundu associate with the keeping of cattle have been taken over with the cattle themselves. The traits agree in principle and detail with the factors of the African cattle-keeping areas. The characteristics of this pastoral culture have been outlined by M. J. Herskovits (*The Cattle Complex in East Africa*, *Amer. Anth.*, XXVIII, 1926, pp. 270-272; 424-528; 630-664). I wish, however, to give prominence to the factor of sacred fire which is fundamental in the cattle-keeping culture. The importance of sacred fire in the ritual of the Ovimbundu has been demonstrated, and this trait is a most important link between the typically Negro culture of the Ovimbundu and the Hamitic pastoral culture of east Africa.

A brief summary of the salient facts of the cattle-keeping culture, such as is found in east and south Africa, will be given. This will be followed by a statement of the cultural traits associated with the keeping of cattle among the Ovimbundu in order to demonstrate similarities of custom.

In describing cattle-keeping people of the Lakes region J. Roscoe (VI) outlines a pre-pastoral condition characterized by agricultural pursuits which still survive near Ruwenzori and Elgon. Of the pastoral people the most conservative are the Banyankole of Ankole, among whom all social customs fall into line with the keeping of cattle. Milk is the principal food, and strong purgatives are taken after eating vegetable food, which is regarded as unclean. Agriculturists are a serf class who are not allowed to have milk. A woman of the pastoral class would not accept a husband from the agricultural people, because they are social inferiors. In such a community one finds a strict preservation of customs centering in cattle. Bulls are killed beside the grave of a chief, while cows are dedicated to the dead chief at whose shrine their milk is offered daily (p. 21).

Roscoe's account of the worship of the dead in Uganda (III) further explains customs that are characteristic of pastoral communities in which the connection between cattle-keeping and kingship is important. The death of the king is not announced and the fact of death is kept secret for several days until preparations for the succession have been made. "The fire is extinct" is a euphemism which refers to the death of the king. The king is buried in a hut surrounded by a fence. This hut is later visited by the new king

who cleans and decorates the jawbone of his predecessor, then preserves it in a case of lion skin. Among the Basoga the skull of the king is cleaned and stitched in cowhide. It is then placed in a temple where a medium lives in order to converse with the ghost of the king (p. 43). The Bunyoro line the grave of a king with cowhide, and the slaughtered cows are said to serve the dead king with milk in a spirit world.

Roscoe (I, p. 101) states that the Bahima wrap the body of a king in the skin of a freshly killed cow; the deities are not often invoked, but attention is paid to ancestral ghosts (p. 109). There is a Bahima custom of making blood brotherhood by drinking blood mixed with milk (p. 117). The Banyankole (Roscoe, V, p. 32), institute a blood brotherhood by rubbing each other with blood drawn from their navels by an arrow. The body of a king is sewn in cowhide (p. 58). A cow is killed and eaten at the grave of a chief (p. 146).

A further examination of Roscoe's observations (IV) adds corroborative information. The Bakitara have rain-makers for each district (p. 28). There is a ritual for establishing blood brotherhood (p. 46). At the king's death all fires in the royal enclosure are extinguished; so also are the fires in each royal cow kraal. Fresh fires are made by friction in the new royal enclosure from which fire is distributed to the kraals (p. 47). The Bakitara test two litigants or accused persons by asking each to provide chickens which are made to take poison (p. 70). The death of the king is not announced for some days; he is said to be asleep. A young bull is killed to provide a shroud for the king's body (p. 121). The king's spear and walking stick are kept in the tomb (p. 126). At the death of a king of the Baganda the guardian of the king's sacred fire is strangled. A war leader rubs himself with ashes from the sacred fire in order to increase his strength and courage (Roscoe, II, pp. 103, 349).

The concept of the sacred fire has spread, not only down the east side of Africa and into Angola, but northeastward to the Lotuko-speaking peoples. Here a new fire has to be kindled at the initiation of a member of the drum-house. At puberal initiation ceremonies for boys, the rain-maker creates new fire with twirling sticks, which are never again used, though they are preserved. All fires in the village are extinguished before the new fires are made. The freshly ignited fire is distributed first to drum-houses then to the homes (C. G. and B. Z. Seligman, *Sudan Notes and Records*, VIII, pp. 12,

15). Fire is kindled on the grave and tended by a relative for thirty days (p. 38).

When the Masai desire rain, a fire of cordia wood is lighted. Into this a medicine-man throws charms, after which several medicine-men dance round the fire and sing (A. C. Hollis, *The Masai*, p. 348).

Bösch states that the Banyamwezi have a fire-making rite which is symbolic and religious, "mais avant tout il est magique." The new fire is made annually at the brewing of the first beer. New fire is made when epidemics of sickness occur, also at the inauguration of a new chief. The Ovimbundu make and distribute new fire on each of these occasions. The Banyamwezi strangle their decrepit king but do not announce the death. A report stating that the king is sick is issued (*Les Banyamwezi*, pp. 229-233).

The usages of the cattle-keeping Ovambo (of whom the Vakuanyama of southern Angola are a section) and the Herero, are of paramount importance in this research because of their proximity to the Ovimbundu.

H. Vedder (III, p. 156) has come to the conclusion that the Herero represent the southern extremity of a racial migration from the region of the Great Lakes, and this is the generally accepted view. Vedder states that the Herero came through the south of Angola, crossed the Cunene River, and entered the Kaokoveld (p. 166). From a study of native traditions, philology, and cultural elements, there is reason for supposing that the Ovambo, including the Vakuanyama, extended farther into Angola than they do today; hence contacts with the Ovimbundu were probably frequent, and possibly continuous for a period.

C. H. L. Hahn has recently made an analysis of the traits of Kuanyama culture. His introductory pages give an account of Kalunga, a supreme being whose name is coupled with the name Nangombe. There is here a philological resemblance to words used by the Ovimbundu. *Kalunga* is an Umbundu word meaning "greetings," "sea," "lord," and "death," the meaning varying with the context and accent. *Ongombe* is the Umbundu word for ox, while *Kangombe* is the name of more than one chief of historical importance. The Herero respect a supreme being whom they call Ndjambi Karunga. *Nyambi* is a well-known word in the Congo region, and the Ovimbundu have the word *Njambi*, or *Na-Njambi*, which means "Lord Njambi."

The Ovambo will not allow the tribal fire of the chief's kraal to burn out because it is the life of the people (Hahn, p. 3). This author writes in the past tense, from which one infers that the customs he describes have declined. Two old men were the keepers of the sacred fire; these guardians were chosen from the circumcised men (p. 17). The fire was never allowed to flare, but only to smolder. No one referred to this fire, nor was anyone allowed to sit near it, cook over it, or warm himself. The whole tribe received the fire from the chief, who originally gave it to the headman for distribution to commoners (p. 18). Hahn remarks that, although these customs are declining, they are still observed by the Vakuanyama, the branch of the Ovambo which is in closest contact with the Ovimbundu.

In the same publication (III, p. 68) Vedder says of the Berg Damara that a series of religious ideas centers in the holy fire which burns perpetually on the eastern side of a sacred tree in the middle of each village. At this fire the elders cook their meat, and here the council meeting is held. In order to obtain a seat at the holy fire a young man has to submit to initiation as a hunter on three occasions, at intervals of a year. Children may not play at the holy fire. When hunting becomes unprofitable the Berg Damara move to a new site, and a glowing piece of wood is taken from the sacred fire in order to kindle a new one. This is the practice described in connection with the formation of a new village site by the Ovimbundu. A more detailed account of sacred fire is given by Vedder (II, pp. 23-27).

L. Fourie, another contributor to "Native Tribes of Southwest Africa," shows that the Heikom Bushmen have a sacred fire kindled and owned by the headman, who is the only person who knows how to bring from this fire the properties which induce health and well-being. When making a new settlement the headman kindles the new fire under the sacred tree, and fire from the old camp may not be used. After the headman has dropped herbs into the fire and has lighted his pipe therefrom, his wife takes brands for kindling the fire in her hut. The fire is then distributed from this point among the whole group (p. 87).

The center for religious worship among the Herero is an ash heap in which a weak fire glimmers. This is blown into a blaze only on festive occasions. The fire is always situated between the chief kraal and the house of the principal wife. Round the fire lie horns of cattle which have been slaughtered as an offering (Vedder, III, p. 167). The holy fire is a gift from Mukuru, and extinction of

the fire means disaster for the tribe. If the fire should die out, only the priest as living representative of Mukuru may rekindle it. The relighting is done by means of fire-sticks, which are said to be male and female. A traveler makes sure of the blessing of his ancestors by taking a firebrand from the holy fire with him. When laying the foundation of a new house the builder must obtain a firebrand from the fire of a recognized priest-chief.

To corroborate the information given by Vedder, one may turn to the work of J. Irle (II, pp. 337, 342, 346). The soul, which is not corporeal, is identified with the heart as among the Ovimbundu and in the southwest Congo. The Herero use sandals which they bury with the dead. Probably the Ovimbundu have borrowed the idea of sandals from this southern culture, since there are no sandal-wearing people found on any other side of them. The Herero speak of Ndjambi, and Irle asks, "Who is Ndjambi, with whom they so frequently associated the name Karunga?" They say that Karunga is Ndjambi who sends rain, thunder, and lightning. The Herero say, "Karunga dwells in heaven. He does us only good, therefore we do not fear him and do not sacrifice to him." Holy fire, which is never allowed to go out, is made with fire-sticks in the ancestor house.

A. W. Hoernlé has commented on the use of sacred fire by the Hottentots. *Nau* is a mystic force; for example, an animal killed by lightning is *nau*. As soon as a person becomes *nau*, the fire in his hut is *nau* and must no longer be used for cooking. A fire kindled with the fire-sticks is used for the purification ceremony of a girl who menstruates for the first time. After the ceremony she may resume her milking duties. The Hottentots use the sweat bath as a means of purifying mourners. An article entitled "The Sacred Fire of the Bapedi of the Transvaal," by W. M. Eiselen, adds important data to the notes given here.

All this evidence from east and southwest Africa is in close agreement with personal observations among the Ovimbundu. The contacts of the Ovimbundu with southern Angola are established facts, hence history and geography render the hypothesis of a derivation of culture probable. The Ovimbundu regard cattle as an estimate of wealth and social standing. Usually the animals are not killed or milked, but they are used to pay fines, and to make purchases.

In dealing with kingship among the Ovimbundu I note a strong resemblance to customs prevailing near Victoria Nyanza, the

principal focus of the cattle-keeping areas. The king's death is not announced by the Ovimbundu. There is a special hut for burial, and part of the head is later removed for decoration and separate interment. This part of the royal corpse is subsequently brought out for worship and supplication. The Ovimbundu never admit the death of a king until a successor has been chosen. The king's body is buried in oxhide, but the head is severed by suspending the corpse with a rope round the neck, then twisting the body. The head is sewn in oxhide and kept in a box. In time of drought or before a journey a chief or medicine-man visits the head to make a sacrifice and ask for help. Oxen are killed at funeral feasts of the wealthy and the horns are mounted over the grave. Mourners for the king wear strips of oxhide round their wrists.

There can be no doubt that the Ovimbundu received the above traits, also their knowledge and use of the sacred fire, from the cattle-keeping area. The use of sacred fire has been shown to be a primary trait associated with the keeping of cattle. Reference to field work among the Ovimbundu indicates that the usages connected with sacred fire agree in detail with those of the pastoral area. The Ovimbundu keep the sacred fire burning in the burial place of kings; for instance at Ngalangi, as described. The Ovimbundu create new fire by twirling when a new village site is opened, and the fire is distributed from the chief's home. Lustration after an epidemic of sickness is always ceremonially carried out by creation of new fire on which the blood of sacrificed animals is sprinkled. Therefore, in general outline and considerable detail the factors associated with cattle-keeping among the Ovimbundu are those of the pastoral areas of east, south, and southwest Africa.

In summarizing we may say that contacts of the Ovimbundu with southwest Africa have arisen from occupation of contiguous territory, along with trading and raiding. The acquisitions made by the Ovimbundu from pastoral tribes include several artifacts such as sandals, the assagai, and the throwing club. More important than the diffusion of these objects into Umbundu culture has been the reception of the cattle themselves, along with the social values, usages, and religious beliefs which are the usual concomitants of the African pastoral culture.

A study of the culture contacts of the Ovimbundu conclusively shows that they are not an isolated people whose artifacts, religious beliefs, and social life stand out distinctively from the culture patterns around them. On the contrary the Ovimbundu have,

through trade and warfare, been an absorbent people, reaching out in all directions and assimilating all cultural traits which were of service.

Up to this point, only the immediate culture contacts of the Ovimbundu have been considered. Yet it is evident that some of the cultural traits which have been discussed are widely diffused in Africa. Consequently, some further inquiry is needed if the tribal life of the Ovimbundu is to be considered against a broad ethnological background of African culture.

## XI. WIDER CULTURE CONTACTS

When dealing with the immediate culture contacts of the Ovimbundu, the traits found in central Angola were considered in relation to the cultural elements of each of three areas, the Congo basin, Rhodesia, and South West Africa. In this chapter attention is given to some traits that are found, not only among the Ovimbundu and adjacent peoples, but among some other African tribes remote from the present-day location of the Ovimbundu. The Graebnerian school has indeed claimed that some of these widely distributed African traits are Melanesian and Indonesian in origin, a theory which is briefly considered in the latter part of this chapter.

The present examination of widely distributed traits is facilitated by referring to each of a number of papers not previously mentioned. For example, E. Torday (IV) has dealt in general with religion and social organization among Bantu tribes. H. Baumann (II) has discussed hoe-culture and matriarchal conditions in Bantu Africa. G. Lindblom (I) has brought together a large body of evidence relating to the distribution of hunting devices. H. Balfour (I, II, III) has outlined the distribution of the friction drum. Hence there exist useful summaries of trait distributions with which cultural factors of the Ovimbundu can be compared.

### ANTIQUITY OF CULTURAL TRAITS

At the outset we must recognize that the extent of distribution of a trait and its importance in the cultural pattern may be but a treacherous guide to its antiquity. The widespread use and cultivation of tobacco and maize are instances of this kind. The growth and curing of tobacco led to the adoption of this commodity as a medium of exchange which could be conveniently carried by caravans. Exchange of snuff as a form of greeting, also the passing of a communal pipe from hand to hand in the men's house, are instances of social usages which caused a rapid spread of a commodity in a short time (Laufer, Hambly, and Linton, *Tobacco and Its Uses in Africa*, Field Mus. Nat. Hist., Anthr. Leaflet 29, 1929).

The use of maize, one of the most important factors in the building and preservation of Umbundu culture, has a wide distribution in Africa, but its introduction is dated only from the sixteenth century. The Portuguese carried on a regular traffic in slaves between Angola and Brazil, and in all probability this resulted in the introduction of manioc, peanuts, and sweet potatoes. Possibly

the yam also was introduced. All these food plants spread with great rapidity, hence the extent of their distribution is not a guide to their antiquity.

#### THE BLACKSMITH'S CRAFT IN AFRICA

The antiquity of the blacksmith's occupation is not easy to determine, though the usefulness of the craft, and the accessibility of surface-ore in many parts of Africa, might incline one to favor a theory of rapid diffusion. There is an extensive literature dealing with the origin of the blacksmith's craft, which is variously attributed to the Negro, the ancient Egyptians, or to Hamitic invaders.

Diffusion of the craft, and not independent invention in many parts of Africa, is suggested by the continuity of like forms of apparatus; taboos of the same kind connected with the blacksmith; treatment of smiths as a special caste; also their employment of ritual in making furnaces, training apprentices, and consecrating their tools.

Iron objects requiring considerable skill in their manufacture are described by the earliest writers who came in contact with northern Angola, and early observations relating to iron gongs and axes have already been given. This evidence therefore suggests that the Ovimbundu must have had a knowledge of the working of iron when they entered the Benguela Highlands.

The following data from many parts of Africa are adduced to show the relation of the blacksmith's craft among the Ovimbundu to a wider background, of which Umbundu customs form a part. The Ovimbundu have developed ritual aspects of the blacksmith's craft which have already been described, and along with these the following instances should be considered.

Naturally, special local developments occur, but the general attitude of the Ovimbundu toward blacksmiths is in accord with a widely distributed body of African beliefs affecting Bantu, semi-Bantu, Sudanic, and Hamitic-speaking tribes, from which a few instances may be noted.

Among the Kpelle of Liberia a blacksmith receives no pay for work done for a chief, but he is free from military service. The blacksmith is a confidential person for the whole village, and he is conversant with many family secrets (D. Westermann, *Die Kpelle*, p. 170). Blacksmiths of the Ibo of Nigeria form a strong union which resents intrusion into the secrets of the craft. Blacksmiths are to be found only in certain towns which form halting places on

their itinerary (G. T. Basden, *Among the Ibos of Nigeria*, p. 176). At Ife in a sacred grove I saw objects which were described as the hammer and the anvil of the first blacksmith. Over the anvil stone were the remains of a recently sacrificed dog. Such an offering is made twice a year to Ogun, the patron god of blacksmiths. Among the Masai, blacksmiths are said to be unlucky with cattle, and are therefore not allowed to own them. Smiths have their own language which is not well understood by other people of the tribe (A. C. Hollis, *The Masai*, p. 331). The Suk say that no woman may see a blacksmith at work because his tools would become heavy in his hand, then he would go mad and die. There is chanting by the blacksmiths during forging and molding (M. W. H. Beech, *The Suk*, p. 18).

Working in iron is accompanied by many special rites among the Bakitara; in fact, taboos are observed from the time of preparing the charcoal. Smiths belong to the serf class. Among the omens, sneezing is a warning from a ghost indicating that there is danger near and work is therefore discontinued. Offerings are made to the spirit of the hill where ore is dug in order to prevent burial of the diggers (J. Roscoe, IV, p. 218). When a Banyankole smith is making a new hammer he gives a feast at which six goats are killed. This sacredness of the large hammer was emphasized among the Ovimbundu.

Southwest of Lake Bangweolo a small shrine is erected near the smelting furnace, and here a prayer is offered to spirits of former smelters (H. B. Barnes, *J.R.A.I.*, LVI, p. 191). The Ila-speaking people of Rhodesia have a principal blacksmith who is named *munganga wa butale* ("the iron doctor"). Secrets of the craft are preserved by transmission from father to son only. The *munganga* takes charge of the preparation of iron and directs the ceremonies (E. W. Smith and A. M. Dale, I, pp. 203-207). E. Torday records that the Bambala have a T-shaped hammer with a pointed handle. "It is practically impossible to obtain a specimen of these hammers since death is the portion of a smith who parts with his tools." (I, p. 406.)

These examples do not reveal the origin of the blacksmith's craft and its ritual, but they explain Umbundu customs as part of a system of ideas which affects the whole continent of Africa south of the Sahara.

#### BANTU RELIGION AND SOCIAL SYSTEM

The spiritual beliefs of the Ovimbundu have already been shown to agree with those of the Congo basin and southwest Africa.

E. Torday's paper, "Dualism in Western Bantu Religion and Social Organization," is an admirable summary of a wide background of Bantu beliefs with which those of the Ovimbundu agree in detail. Torday (VI) has also given a summary of Bantu sexual relations. His summary of prenuptial relationships of boys and girls, the system of polygyny, and domestic arrangements in general, indicates that records made among the Ovimbundu are but a sample of an extensive and homogeneous series of Bantu sex customs.

With regard to the classificatory system of relationships and cross-cousin marriage, sufficient quotations have been given to indicate that the system of the Ovimbundu is one which is paralleled in Rhodesia, the Congo basin, and still more remote regions. To the instances given should be added corroborative examples from J. Roscoe (*The Baganda*, p. 109), R. S. Rattray (*Ashanti*, p. 29), and H. A. Stayt (*The Bavenda*, pp. 172-184). L. H. Buxton and R. S. Rattray have offered a theory to explain the kinship system and cross-cousin marriage in Ashanti (*Jour. African Soc.*, XXIV, p. 83; *Religion and Art in Ashanti*, p. 318).

In Africa a classificatory system of relationships is particularly characteristic of the Bantu area. The system is Semitic and Hamitic. It is not reported among the Bushmen, but is in vogue among the Nama Hottentots. The wide distribution of a classificatory system, with variations, and its importance in tribal life, suggest antiquity (see Hoernlé, II, and B. Z. Seligman, III).

H. Baumann (I) has prepared maps showing the distribution of customs affecting descent of property in Africa. Investigation among the Ovimbundu proves that their scheme of inheritance of property is part of a more widely distributed system. Baumann (pp. 66, 127) states that in the Kasai valley and the Cabinda Enclave the rights of the mother's brother are expressed in his control of his sister's children. The power of the maternal uncle in Ovimbundu families was reported, and it was stated that he has the right to sell his sister's children for redemption of his debts. Baumann's map further indicates an area in which property descends, not to a wife or children, but to a mother's brother, or to the sons of the deceased man's oldest sister. The social system of the Ovimbundu is definitely a part of this cultural matrix, which extends to the north and north-east of the Ovimbundu but, according to Baumann's record, not to the south of Angola. In the south of Angola among pastoral people a system of succession and inheritance in the male line prevails, and

this method is characteristic of many pastoral tribes of south and east Africa.

The Ovimbundu are situated between two systems of reckoning descent, succession, and inheritance; namely, the Negro system of the Congo region, and that of the eastern and southern cattle-keeping people. In view of the culture contacts described in Chapter X, the mixed system of the Ovimbundu is intelligible.

On the one hand the Ovimbundu emphasize the rights of the mother's brother while denying inheritance to a wife and her children, but in royal families the eldest son of the principal wife succeeds to kingship. Among commoners descent is reckoned through both the father and the mother. Therefore the inference is that the Ovimbundu have, by virtue of their position and contacts, made a blending of two distinct social systems, one of which gives succession to office in the male line, while the other gives inheritance in the female line. In their system of burial rites for kings the Ovimbundu follow the usages of the pastoral area.

Exchange of blood is an Umbundu custom resembling that which occurs widely in Negro Africa. This exchange of blood is the typical Negro form of the blood brotherhood. Another rite is the Hamitic custom of drinking a mixture of blood and milk; this the Ovimbundu do not practise.

The hoe-cultivation practised by Ovimbundu women is in agreement with Baumann's association of hoe-culture and matriarchal conditions, the latter being indicated by the importance of the mother's brother. These concomitant factors are shown by Baumann (II, p. 292) to be characteristic of a wide area in the Congo basin. To this area may be added the whole of central Angola.

The factors of slavery among the Ovimbundu are in agreement with all that is known of the treatment of slaves in the Congo area and farther west Africa. Slaves of the Ovimbundu taken in warfare were treated with less consideration than those who passed into slavery to redeem a debt. There was also discrimination in favor of slaves taken in local quarrels among the Ovimbundu themselves. The killing and eating of slaves in north Angola is a custom whose early occurrence has already been noted.

#### AFRICAN PUBERTY RITES

Initiation ceremonies for boys and girls are at present well preserved among the Vachokue of eastern Angola; for a period such ceremonies declined among the Ovimbundu, but there is now a

recrudescence. Masks of eastern Angola most closely resemble those of the Bapindi of the southwest Congo, but the general background of these puberty rites is comparable in Angola, parts of the Congo, and in several parts of the forest belt of west Africa from Sierra Leone to Cameroon.

Usually there is seclusion, hardship, training in dances and tribal customs, with ceremonial reappearance and change of name. Evidently the Ovimbundu share the material traits and the psychological background of initiatory rites with a very large number of tribes, which occupy the forest zones of west and central Africa.

G. Lindblom's publication, "The Use of Stilts in Africa and America," helps to explain the occurrence of stilt-walking at the final ceremonies of initiation witnessed at Cangamba. Since stilt-walking in Angola occurs chiefly in the eastern section, perhaps one should link the trait with the stilt-walking in Nyasaland, because there has been continuous communication from Angola to Nyasaland along the Zambezi valley. The stilt-walking of eastern Angola may, however, be a cultural offshoot from the southwest Congo, for according to Lindblom the stilt-walking trait occurs there, and the contacts of eastern Angola with the southwest Congo have been important.

In turning from these factors of social life to traits of a more material kind, there are points of importance to be noted in connection with food supply and industries. A possibility exists that such traits as hunting, use of certain types of musical instruments, basketry, and pottery, will indicate that the Ovimbundu, before their separation, drew some of their fundamental traits from a widely distributed matrix.

#### HUNTING APPLIANCES OF AFRICA

L. S. B. Leakey (A New Classification of the Bow and Arrow in Africa, *J.R.A.I.*, LVI, pp. 259-294) has dealt with the distribution of bows and arrows. Leakey states that, owing to lack of evidence, he was unable to describe the bows and arrows of Angola. I have therefore illustrated these in detail (Plate XVII, Figs. 1-9).

Some of the arrowheads used by the Ovimbundu resemble those of the Bashilele in the southwest Congo, but on the whole arrowheads used in Angola are of distinctive patterns, and presumably they represent a special local development. The round bow of the Ovimbundu and the Vachokue is like that of the southern Congo, and it is absolutely distinct from the short flat bow used in southern Angola among the Vakwanyama.

The question of arrow release is important in this connection. R. B. Dixon (*The Building of Cultures*, p. 131), while discussing evidence from Wissler, Kroeber, and Morse, has plotted a map showing the distribution of types of arrow release in all parts of the world. The Ovimbundu (Plate XXXIX, Fig. 1) use the Mediterranean release, which is shown by Kroeber (*Univ. Calif. Pub.*, XXIII, p. 286) to occur in the southwest Congo region along with the tertiary release. My illustration and Kroeber's description of the Mediterranean release show that the thumb is kept entirely out of the way. The string is engaged by the inner surfaces of the tips of the index and middle fingers. The engaging finger-ends are at right angles to the string.

Young boys often use the primary release when shooting blunt wooden arrows at birds. In this release the butt of the arrow is clasped between the end of the thumb and the middle knuckle of the index finger. Kroeber remarks that the primary release is almost invariably attempted by children and uninstructed novices, which accords with my observations made in Angola. Presumably boys of the Ovimbundu change their method of release from the primary to the Mediterranean when they handle a man's bow and arrows. The Mediterranean release was observed throughout Angola, with the exception of the primary release employed by boys.

G. Lindblom (I, Part I) assists in comparing hunting apparatus of the Ovimbundu with a large number of African forms.

The throwing clubs of the Ovimbundu are definitely like those of the Hottentots, Barotse, and Bushmen (pp. 120-126).

In Part II of his leaflet Lindblom discusses many kinds of traps. The trap built of heavy poles, which is used for catching lions, leopards, and hyenas, is used all over Negro Africa; there is nothing distinctive in the form and use of the Umbundu pattern. The cane rat trap of conical form is described and its distribution is plotted (pp. 52, 53, 56). Lindblom's map shows a clustering round the mouth of the Congo, also again at Long. 30° E. and Lat. 10° S. The blank for Angola can now be filled. These traps are used in many parts of Angola, notably among the Vasele of the northwest, at Elende, Ngalandi, and Cangamba. The use of this trap in Angola explains its presence among the Vakuanyama. On Lindblom's map the occurrence of the trap in south Angola is isolated from the general African distribution, but use of the trap is really continuous from the Congo estuary through Angola to the Vakuanyama.

The use of bird-arrows with blunt, wooden knobs was common at Elende, and I collected sharp, barbed, wooden arrows from the Vasele, also from the areas of Kipungo and Mongua. This will assist in extending the information given by Lindblom (pp. 94-98). Lindblom's map (p. 99) indicates that bird-arrows are used round Lake Victoria Nyanza, at the junction of the Kasai and the Congo, and likewise among the Bushongo and the Bayaka. My observation of the distribution of wooden arrows in Angola links up these regions shown by Lindblom with the south of Angola. Perhaps a trans-continental diffusion in a southwesterly direction from Victoria Nyanza may be assumed, for it is unlikely that the diffusion would go counter to the generally accepted line of tribal migration which has been from northeast to southwest.

#### AFRICAN POTTERY, BASKETS, AND MUSICAL INSTRUMENTS

There is no reason to connect the pottery of the Ovimbundu with that of any particular region. The coiling method is far too widespread and generic to afford evidence of contacts. The Ovimbundu have evolved their own peculiar designs and forms.

In coiled basketry also the Ovimbundu have made special developments from a generic trait known in Egypt before 2000 B.C. Designs and dyes appear to be of local origin. My observation of African basketry does not suggest any particular parent form; moreover, resemblances of design may be misleading, for the nature of the material controls the shapes of the designs to a great extent in coiled basketry.

Wood-carving, on the contrary, links the culture of the Ovimbundu very definitely with that of the southwest Congo. Perhaps the work of Angola is most closely allied with that of the Bakuba, who excel in the carving of figurines, cups, and staffs.

H. Balfour's article (III) on the distribution of the friction drum helps to identify the form used by the Ovimbundu with types of this instrument from other African areas. The type from Elende is like that of Barotseland with which the Ovimbundu caravans were frequently in contact, while the large friction drum from Ngalangi is of the Bayaka pattern. The friction drum is widely used in the southwest Congo among the Bakwese, the Bambala, and the Baluba.

Thus far research has been able to show a large number of cultural traits of the Ovimbundu in relation to immediate culture contacts of the Congo basin, Rhodesia, and South West Africa (chapter X). In addition to this, many traits connected with social

culture elements of Negro Africa. Among the cultural traits of the Ovimbundu are a few which the Graebnerians would claim as evidence of the passage of Indonesian cultural waves. Use of the bow is part of the bow culture. Matriarchal conditions and hoe-culture by women would be regarded as a somewhat later wave of culture. Frobenius would ascribe the use of netted clothing during initiation to an Oceanic origin. There is a small area in southeast Angola where pile dwellings are built by the Ambuella tribe. Bark cloth is made in eastern Angola. The marimba and the musical bow are traits of Umbundu and Oceanic culture.

The point at issue seems to be the acceptance or rejection of cultural contacts on the ground of alleged resemblance in forms. Frobenius would doubtless add that the supposed Malayo-Negritan factors in Umbundu culture lie only a little to the southwest of the Zambezi, which is a main line of hypothetical migration of Malayo-Negritan factors.

Each of these elements of Umbundu culture is of a non-specific kind. For example, there is nothing about the bark cloth, except that it is a bark cloth, to link it with similar material in any other part of the world. Stripping the tree, soaking the bark and beating it, are part of the general technique.

The musical bow has a wide distribution, as H. Balfour (I) has shown. He studies the distribution in Africa, North and South America, Asia, India, the Malay Archipelago, Melanesia, and Polynesia. He postulates the derivation from the archers' bow and says (p. 85), "The question whether or no we are to regard the musical bows in India and in Africa as belonging to one family, is one which is difficult to answer." Balfour is impressed with similarity of forms in India and Africa, but feels that the common origin is not demonstrable.

When comparing types of masks and costumes within the African continent itself the work of Frobenius (I) is found to be useful in indicating areas over which certain types of regalia are used in initiation ceremonies. There is undoubtedly a localization of types, and we previously noted that Angolan forms of masks and costumes are definitely like those of the Bakuba and the Baluba in the southwest Congo region. Moreover, the netting costumes used by the Ovimbundu and the Vachokue of Angola closely resemble those used in some parts of the Congo basin, Cameroon, and from that point westward to Sierra Leone. Therefore, so long as comparisons are

limited to Africa itself, they are instructive in showing cultural traits of Angola against a broader background.

But if the inquiry is extended with a view to proving that African masks and costumes are derivatives from Oceania, there exists no acceptable evidence of generic relationship. The mere use of fiber skirts, of netting suits, and of bark cloth for masks, is not acceptable evidence for supporting a theory of derivation of African from Oceanic forms.

More important than the study of forms is the psychological background of masks and costumes in Africa and Melanesia. In "Origins of Education" I made a comparison of factors included in the initiation of boys in Africa and Melanesia. The boys are secluded, circumcised, instructed, harshly treated, and after a change of name are reintroduced to their villages at a dance in which masks and costumes are used.

Waiving the question of similarity of masks and costumes, do the psychological factors provide reasonable grounds for assuming generic relationship of initiation customs? Possibly the psychological setting suggests a single origin, but the matter is so largely subjective, that a decision cannot be made without further evidence of the correlation of forms, the details underlying their origin and use, and the establishment of a more definite and unbroken track of distribution. To have an intuition and a vague hypothesis is very different from the demonstration of a theory. Delafosse (*Negroes of Africa*, p. 3) pictures the peopling of Africa by Negro impacts from Asia on the east coast near Madagascar. If true, this suggestion would support the views of the Graebnerian school, but the theory is highly speculative.

The extent to which an observer may be misled by fortuitous resemblances in form has been demonstrated by a number of American anthropologists. Every investigator who attempts comparative study and classification is prone to unite concepts, customs, and artifacts which have only a superficial and misleading resemblance to one another. This failure to discriminate may be illustrated as follows: R. H. Lowie (*Plains Indian Age-Societies*, *Amer. Mus. Nat. Hist., Anth. Papers*, No. 11, pp. 883-951) has shown the fallacy of assuming genuine cultural resemblances between Age-Societies of Plains Indians, the Masai, and the Melanesians, because the phenomena when analyzed prove to have different psychological settings, and they are structurally as distinct as are their geographical areas.

W. D. Wallis points out the care that should be exercised in assessing the evidential values of culture traits. These should be weighted according to their simplicity or complexity, and their logical connection with one another (*Amer. Anth.*, XXX, p. 94). The cultural factors of the Malayo-Negritan migration have not been considered in the manner advocated by Wallis.

Lowie examined apparently similar cases of exogamy, but found that these depended on different conditions; for example, exogamy might depend on either clan or locality (*The Principle of Convergence in Ethnology, Jour. Amer. Folk-lore*, XXV, pp. 24-42).

A. A. Goldenweiser shows that totemism has many social and psychological interpretations differing greatly according to locality. In order to include the many forms of totemism a broad definition has to be accepted. Totemism is indeed nothing more than a tendency of social units or individuals to become associated with symbols of emotional value (*Totemism an Analytical Study, Jour. Amer. Folk-lore*, XXIII).

Lowie further emphasizes the distinctive types of totemism, in order to show the fallacy of linking many different concepts under one term, without recognizing the broad significance of the term (*Amer. Anth.*, XIII, p. 189). This research shows Frobenius to be at fault in merely noting the presence of totemism and other traits without defining their forms and examining the psychological background.

An article by A. L. Kroeber and C. Holt (*Masks and Moieties as a Culture Complex, J.R.A.I.*, L, p. 452) has a special bearing on Graebnerian views with regard to the spread of cultures. Kroeber set out to test the validity of the statement that North American culture had been affected by the east Papuan layer of the Graebnerian culture stream, which was supposed to have brought masks and moieties to North America. The Graebnerian method assumes that a culture trait never develops twice; also that instances of geographical isolation of a trait must be ascribed to migration and subsequent loss in intervening areas. The conclusion of Kroeber, based on statistical examination of instances of conjoint occurrence of the two traits, indicates that the union of masks and moieties comes out fortuitously.

R. B. Dixon indicates several factors to which attention should be paid in making comparisons of culture traits (*Science*, XXXV, p. 46). In the first place there is the question of relationship on geographical and historical grounds. It is also important to know

what degree of complexity there is in the artifacts and beliefs which are under comparison. Reason and form, that is, psychology and morphology, are both important aspects of comparison. The work so far accomplished with regard to the Malayo-Negritan theory of African cultural traits fails to comply with the foregoing essentials of comparative study.

There is consensus of opinion against the Graebnerian hypothesis in its present form. E. S. Hartland reviews Graebner's "Methode der Ethnologie" (*Man*, 1914, No. 70) with the result that he finds Graebner too insistent on the value of forms as a criterion of generic relationship. In fact such a method may degenerate into pure subjectivity. F. Boas (*Science*, XXXIV, No. 884) takes the same point of view in remarking on the exclusion of the psychological field of inquiry; Graebner's method has a too mechanical character.

In view of this criticism, and as a result of personal observation of the culture elements of Angola, I am convinced that the somatological, linguistic, and cultural data for considering the spread of the Malayo-Negritan culture in Africa are not sufficiently understood to lead to a demonstration of any kind. For instance, Portuguese East Africa, the hypothetical starting point of the migration, is by no means well studied in detail, and the problem demands that data relating to the supposed area of introduction should be particularly complete.

The same criticism relates to the farthest point of west Africa reached by the supposed cultural stream from Melanesia. A theory which aims at showing generic relationship between secret societies of west Africa and Oceania cannot successfully rely only on general resemblances of masks and the use of netting costumes. Something more specific than a comparison of forms of artifacts and the occurrence of such ill-defined institutions as age-grades, totemism, and secret societies is essential in order to make the kulturkreis theory acceptable.

The problem of cultural relationships between the Ovimbundu and other African tribes is simplified in several ways. Geographical continuity exists between the African areas discussed, and to a great extent the cultural contacts described are matters of historical fact. Data relating to the Ovimbundu themselves are fairly complete; and what is equally important, there is trustworthy literature bearing on the areas surrounding the Ovimbundu. Therefore, comparisons do not rest on the study of a few simple forms, but on the cultures taken as a whole with regard to cultural traits of all kinds.

Evidence adduced up to the present has indicated the relationship of cultural elements of the Ovimbundu to those of tribes immediately surrounding them (chapter X).

In addition to this, the ethnological facts of the present chapter have made it clear that the tribal life of the Ovimbundu cannot be explained by confining the inquiry to immediate culture contacts. The Ovimbundu have without doubt drawn very widely on African cultural streams during the growth of their present social pattern. The truth of this statement has just been illustrated by reference to ritual connected with blacksmiths, Bantu religious beliefs, the Bantu social system, African puberty rites, hunting appliances, musical instruments, and other cultural elements.

A consideration of the *kulturkreis* theory indicated that a search for the origins of Umbundu culture cannot profitably be extended to Indonesia and Melanesia. Therefore the final chapter is confined to a summary of types of African culture, with a view to showing the relationship of Umbundu culture to each of the main racial, linguistic, and cultural patterns that are known to have affected the African continent.

## XII. CULTURAL PROCESSES

### ANALYSIS OF AFRICAN CULTURES

The difficulties of making a study of the Ovimbundu in their relation to a general background of African cultures are connected with unsolved problems of archaeology, physical anthropology, linguistic study, and the history of cultural traits.

With the exception of data from Algeria, Egypt, Kenya, and south Africa there is a paucity of archaeological information which might determine the antiquity of past cultures, the relation of these to past and present races, and the routes by which races and cultures traveled. In the regions mentioned systematic excavations are in progress, but for the greater part of Africa archaeologists have no knowledge of the relative antiquity of stone implements found on the surface.

African ethnologists are not consistent in the connotations of terms such as Bantu and Hamitic. The word Bantu primarily refers to a linguistic family of Negroes, but a Bantu Negro culture exists with many divisions, and later we shall see that a somatological concept is associated with the word Bantu. The word Hamitic may describe a linguistic family, a series of physical traits differing from those which characterize the Negro, and a type of pastoral culture in which all the activities and beliefs of tribal life center in the keeping of cattle. The adjective Semitic can also be used to denote a well-defined linguistic family, a type of culture, or somatic traits. But the Semitic problem does not concern us since the Ovimbundu have no traits that could be associated with Semitic culture, either Mohammedan or pre-Koranic; with the possible exception of blood brotherhood by exchange of blood, and the use of a scapegoat (Robertson Smith, *Lectures on the Religion of the Semites*, p. 296; *Kinship and Marriage in Early Arabia*, pp. 57, 61).

The comparative studies of physical anthropologists are retarded by paucity of skeletal material both ancient and modern, while series of measurements on living subjects, especially women, are inadequate in relation to the great size of Africa and the complexity of the problems which arise from comparative study of anatomical data.

Darwin's "Descent of Man" recognized the possibility of man's origin in Africa, and the recent excavations of L. S. B. Leakey in Kenya may finally prove that the oldest remains of *Homo sapiens*

are within the African continent (Stone Age Cultures of Kenya, Cambridge, England, 1931). H. H. Johnston concludes that the place of origin of the African Negro is unknown. A. C. Haddon (The Wandering of Peoples, p. 54) surmises that "there is reason to believe that all the main races reached Africa from Asia." G. Sergi (The Mediterranean Race, pp. 41-42) regards the Hamites as a single human stock, but disagrees with a theory of Asiatic origin, and postulates the origin of Hamites in northeast Africa.

C. G. Seligman summarizes the views of Sergi and other writers respecting the origin of Hamites (Races of Africa, pp. 96-156). Among the eastern Hamites cranial characteristics, though variable, are generally convergent and are to be regarded as old variations of an original stock. Apart from Negro admixture the face of the Hamite is never prognathous. The nose is straight. The lips are often thick but never everted as in the Negro. The hair is often frizzly, but sometimes wavy or almost straight. The color of the skin varies; it may be yellowish, coppery red-brown, through every shade of brown to black, according to the amount of miscegenation that has taken place. Seligman states "that the Hamitic cradleland is generally agreed to be Asiatic, perhaps southern Arabia, or possibly an area farther east. Be this as it may, there is no doubt that the Hamites and Semites must be regarded as modifications of an original stock" (Some Aspects of the Hamitic Problem in the Anglo-Egyptian Sudan, *J.R.A.I.*, XLIII, pp. 593-705).

As a result of research in the north Arabian desert Henry Field states that the stony desert between Transjordan and the Euphrates River was probably well watered and fertile at an unknown period. The locality may have been a focus, first of concentration, then of dispersal. Archaeological evidence arising from a comparative study of stone implements from Arabia and east Africa, together with data of physical anthropology, and the basic unity of Semitic and Hamitic languages support a theory of Hamitic intrusion from Asia (H. Field, The Cradle of Homo Sapiens, *Amer. Jour. Arch.*, XXXVI, No. 4, pp. 426-430; The Antiquity of Man in Southwestern Asia, *Amer. Anth.*, XXXV, pp. 51-62).

Although the origin of Hamites and Negroes is obscure it has been possible to give a summary of the chief physical traits of the former, and the same can be done for the latter. Typical Sudanic-speaking Negroes, who are sometimes referred to as "true Negroes," are to be seen in the Ibo and Ijaw tribes of southern Nigeria, and among the Kru of Liberia. The characteristics of the Negro are a

heavy torso, disproportionately long arms, a dark skin, prognathous jaws, broad nostrils, thick everted lips, and woolly hair. But usually a modification of these features occurs in Bantu-speaking Negroes. How did this modification of physique arise?

A. C. Haddon (*Wandering of Peoples*, p. 54) expresses a generally accepted view when he states that Bantu-speaking Negroes are a mixture of true Negroes with Hamites. Seligman (*Races of Africa*, p. 181) refers to an infusion of Hamitic blood which has differentiated the Bantu Negroes from true Negroes, and this is a generally accepted hypothesis. But Torday (*H. Spencer, Descriptive Sociology of African Races*, preface, p. iii) questions whether the physical and linguistic cleavage between Bantu-speaking and Sudanic-speaking Negroes is due to an admixture of Hamitic blood. He attributes the physical differences of the two great linguistic divisions of Negroes to disparity of environmental conditions. But at present no physical anthropologist could say to what extent climatic factors, nutrition, and other environmental conditions can be held responsible for the physical differences of Negroes.

The question of a mingling of Hamite and true Negro to produce a modified type of Negro is not the only difficulty. How does one account for aberrant Negroid types such as the Pygmies of the Ituri forest and the Bushmen? They have a phylogenetic relationship, but what is the racial affinity? Again, will change of environmental conditions account for the Pygmy and Bushman types? Or are we to form a hypothesis of origins by assuming establishment of new species by variation or mutation?

In the absence of certain knowledge science accepts a hypothesis which best explains the known facts. And in this matter of a modified Negro type speaking Bantu languages, the idea of a mingling of the blood of Negroes and Hamites best explains the gradation of physical types from west African, Sudanic-speaking Negroes, through various types of Bantu Negroes, to Hamites, as exemplified by the Somali, Beja, and Hadendoa.

The main characters of linguistic families of Africa are clearly defined by A. Werner (*Language Families of Africa*, pp. 20-23) who refers to the works of D. Westermann and C. Meinhof. The distinguishing features of Hamitic, Semitic, Bantu, Sudanic, and Bushman speech are known, yet the task of placing a particular language in its appropriate family is not always simple. The classification may depend on the particular facet of the language which is under examination. Hausa (Hamitic), is difficult to classify

since the language has Sudanic and Hamitic elements with some Semitic roots. The earliest relationships of African linguistic families, for instance Hamitic and Semitic, also Sudanic, Bantu, and Bushman, is a field for further research. To take only one instance of complexity, Bantu is divided into more than two hundred languages and innumerable dialects, whose origin, structure, and evolution have been treated by C. Meinhof (*Introduction to the Phonology of the Bantu Languages*, London, 1932; a translation, by A. Werner and N. J. von Warmelo, of Meinhof's *Grundriss eine Lautlehre der Bantusprachen*).

In conclusion of this summary of the background of African history, there arises the difficulty of ascribing to each of the races those cultural elements for which the race is responsible, either by primary invention within Africa, or by introduction from some source outside Africa. The difficulty may be illustrated by quotations relating to the iron industry of African Negroes. Rival theories claim origin of the craft in Asia, in Egypt, and among African Negroes themselves.

Seligman (*Races of Africa*, p. 158) states, "We may believe that the Negro, who is now an excellent iron worker, learnt this art from the Hamite." Torday writes (H. Spencer, *Descriptive Sociology of African Races*, preface, p. iii), "To state that Bantu civilization—or any civilization whatever—is due to the ancestors of such absolutely primitive tribes as the Hadendoa and Beja (identified by some with the enigmatic Hamites) presupposes that these people who were ignorant of agriculture, or the production of iron, and of all arts and crafts denoting a higher culture, who, as we know, have not progressed a step within the past five hundred years and considered all manual labor degrading, had the power to give that which they never possessed."

The complexity of argument relating to the origin of just one cultural trait, iron-working, can be judged by consulting the writings of W. Gowland (*The Metals in Antiquity*, *J.R.A.I.*, XLII, pp. 235–287), W. M. F. Petrie (*The Arts and Crafts of Ancient Egypt*), W. Belck (*Die Erfinder der Eisentechnik*, *Zeitsch. Ethn.*, XXXIX, pp. 335–381; XL, pp. 45–69; XLII, pp. 15–30), and F. Luschan (*Eisentechnik in Afrika*, *ibid.*, XLI, pp. 23–59).

Even with these reservations and disputed points in mind, it is yet possible to speculate with some accuracy respecting the origin and assembly of traits which, welded together, form the culture of the Ovimbundu.

## ASSEMBLING OF TRAITS

The data which have been assembled in relation to the Ovimbundu, if considered in conjunction with the analysis of African cultures made in the foregoing chapter, lead to the following historical reconstruction.

When somatic traits of the Ovimbundu are considered it is clear that the general type is removed from that of true Negroes. Among the Ovimbundu are persons of a slender, brown-skinned type, with some refinement of lips and nasal width; while other persons possess the opposites of these features, but in no instance as intensely as do true Negroes. I accept the view of physical admixture of Hamites with true Negroes and believe that types like the Ovimbundu and the Vakuanyama have resulted from infusion of Hamitic blood which has modified Negro somatic traits in the way mentioned.

Linguistically the Ovimbundu have a pure form of Bantu speech. The Umbundu language is tonal, but there are few semantic words whose meaning depends on a high, middle, or low tone. Probably Umbundu should be classified with the southwestern Bantu languages, but further research may show that on structural grounds Umbundu has to be accorded an intermediate position between the southwestern and the central Bantu languages. Study of vocabulary definitely links Umbundu with the Ukuanyama language of the southwestern Bantu group, but conclusions based on comparison of vocabularies are hazardous because of the dissemination of Umbundu words by extensive caravan trade of the Ovimbundu. We may therefore be dealing with loan words and not with bifurcation from the same matrix.

When comparing the social pattern of the Ovimbundu with that of other African tribes the following elements of culture should be borne in mind.

- (1) Traits associated with an archaic hunting culture.
- (2) Factors typical of the culture of Negroes, both Bantu and Sudanic.
- (3) Cultural traits from pastoral tribes of south and southwest Angola. These tribes speak Bantu languages but have somatic traits which are Hamitic, while their culture exhibits some main features of the Hamitic pastoral pattern.

Among the earliest elements of Umbundu culture would probably be the traits of hunting and food-gathering. The antiquity of hunting has been indicated by considering the wide distribution of appliances

of like kind. Furthermore, the details of ritual connected with the hunter's occupation, and the survival of these to the present day, tend to show that hunting was not a trait of late introduction. A people who adopted hunting when in an advanced state of their cultural history would not invent an elaborate ritual which is still connected with the initiation of young hunters, ancestor worship, and special modes of burial. Moreover, the Ovimbundu are primarily an agricultural people; therefore it is unlikely that at a late date in their cultural development they would take over hunting and its ritual as a means of augmenting their food supply. I conclude, therefore, that the elements of a hunting culture are ancient and fundamental.

To the archaic elements of hunting and food-gathering should perhaps be added the use of the musical bow, the bull-roarer, and the making of fire by twirling. The bull-roarer is an object associated with important ceremonies among many African and other tribes of the present day, though among the Ovimbundu the instrument is used only as a toy. This is probably a degradation of function associated with the known disappearance of initiation ceremonies. Making of fire by twirling is now of importance only as a ceremonial method of creating new fire at the time of building a village, during epidemics, and after the death of a king. But formerly the twirling method was the only means of ignition.

The most important cultural traits of the Ovimbundu are those which they possess in common with Negroes who speak Bantu languages. Most of the traits mentioned here as characteristic of the Bantu are also to be found among the Sudanic Negroes of west Africa.

Negro cultural traits which are or were prominent in the tribal life of the Ovimbundu are as follows:

    Tooth mutilation and scarification of the body.

    Blood brotherhood by exchange of blood.

    Hoe cultivation by women.

    Classificatory system of kinship terms and cross-cousin marriage.

    A system of succession, inheritance, and family government in which the maternal uncle plays an important part.

    Tribal government under a well-coordinated political system in which kings and village chiefs are of paramount importance.

    Slavery as an economic institution.

    Ritualistic slaughter and eating of slaves at the death of a king.

Tribal initiation for boys with use of masks, netting costumes, seclusion, circumcision, harsh treatment, change of name, and re-introduction into society.

The poison ordeal of general Negro type.

Religious ideas of a supreme being, Suku, Nzambi, or Kalunga, who is thought of as a creator. He is, however, far removed from all tribal affairs, and there is no sacrifice or appeal to him.

An active ancestor worship with good and bad spirits who require sacrifice and recognition by supplication through the agency of a medicine-man. Use of wooden figures in connection with this appeal to spirits. Great importance of the spirits of kings as arbiters in matters of tribal welfare.

Importance of medicine-men in conducting trial by ordeal, making rain, healing the sick, and consulting ancestral spirits by divination and the use of wooden images in which "medicine" is placed.

Methods of fishing with poisons and conical fish traps.

The technique and ritual of the blacksmith's craft.

Wood-carving which particularly resembles that of the southwest Congo region.

Making of bark cloth.

Types of musical instruments, including the friction drum, the marimba, tubular drums, flat drums, metal-keyed instruments, and many other forms which are typical of Negro culture, particularly that of the southwest Congo.

Weaving on a loom of central African type (now obsolete).

Coiled basketry and pottery.

The foregoing elements are associated to form the cultural pattern of the Ovimbundu. All these traits are characteristic of Bantu and Sudanic Negro culture in general. Therefore the Ovimbundu are most closely allied with Negroes, from the cultural point of view.

The elements taken by the Ovimbundu from pastoral tribes, whose culture has invaded east and south Africa, are:

Cattle and the social values attached to these, together with ceremonial rites which are characteristic of pastoral cultures. Such rites include burial of kings in oxhide, and the killing of oxen at the funeral feast; also the mounting of horns over the grave, and use of sacred fire.

Ideas of succession in the male line, whereby kingship passes to the eldest son of the principal wife, are more characteristic of pastoral than Negro systems.

From the pastoral tribes of southern Angola the Ovimbundu have adopted a peculiar type of assagai, a throwing club, and sandals.

Primarily the culture of the Ovimbundu is that of African Negroes with persistence of traits that have survived, possibly from a pre-Negro culture, which depended entirely upon food-gathering and hunting. Grafted on these traits are important elements from a pastoral culture which is generally conceded to be Hamitic.

European contacts led to the introduction of maize, manioc, sweet potatoes, and peanuts, so stimulating the indigenous hoe culture. This agricultural life was further encouraged by settlement in the Benguela Highlands, where temperature, rainfall, and open spaces favored a great expansion of agricultural pursuits, especially the growth of maize and beans.

Early contact with the Portuguese led to an encouragement of trade. Guns and powder, together with other European goods, were received in exchange for ivory and slaves. An increase in the supply of slaves led to changes in the social life, whereby the Ovimbundu gained more time and opportunity for extensive raiding and trading, by which means their wealth was further increased.

As time progressed, the nature of the contact with the Portuguese changed. Instead of alliances made on a commercial basis, the Portuguese gradually assumed control, the results of which are now distinctly felt in the disintegration of Umbundu tribal life.

The data supplied by personal field work, supported by a perusal of ethnological literature, suggest the foregoing summary as the briefest possible outline of the history of the Ovimbundu, the growth of their culture, and the nature of traits that have been welded together.

Cultural losses will now be considered, and in the final pages an explanation will be given of the way in which traits derived from various sources are associated to form a workable tribal system.

#### CULTURAL LOSSES

The loom and the conical furnace for smelting iron have disappeared in recent times because of the increasing importation of foreign cloth and the greater facility for obtaining scrap iron. Bark cloth, except in eastern Angola, is no longer made because traders are distributing European goods. For the same reason wooden hair-combs are going out of use. Drum signaling has declined with the disappearance of warfare, and for the same reason the double iron gong is rare.

The Ovimbundu have lost any ideas that they may have had concerning sentimental relationships between men and animals. I know of no belief in animal helpers, and of no divisions of people with an animal or a plant as their emblem. The only idea of reincarnation was expressed in the instance of a spirit, neglected in sacrifice, prowling near the village in the form of a lion or a leopard.

There has been a total absence of the shield for so long that no one was able to describe it. Old men state that the Ovimbundu used to have a shield; probably this information is correct, as the shield is commonly used in the Congo region. The Ovimbundu use the bow, spear, and throwing-club; no doubt a fourth item of equipment was more than a man could conveniently manage. Furthermore, individuals who obtained guns and powder would naturally discard other weapons.

Originally the Ovimbundu were cannibals. The Vasele, a sequestered Umbundu-speaking people, were definitely known to be practising cannibalism in 1865 (Monteiro, vol. II, p. 157). The early writers, Battell, Merolla, and Cavazzi, mention cannibalism in northern Angola; undoubtedly slaves were killed and eaten at the accession of a king until late in the nineteenth century. From Bailundu a spear formerly used for thrusting into the side of a slave, then into the side of an ox, was obtained. The flesh was cooked and eaten before a warlike expedition. Among objects from the Esole country is an ax formerly used for beheading slaves at the accession of a new king. These objects, collected in 1929, and described on page 277, are survivals of defunct traits.

Kingship, warfare, slavery, and cannibalism constitute an allied group of factors which are here mentioned in the order of their importance. European contacts have discouraged all these traits. Portuguese authority has gradually usurped the jurisdiction of native kings, and at the same time has discouraged intertribal warfare. With the decline of warfare the capture of slaves became obsolete. In addition to the discouragement of cannibalism by direct legislation, the decline of slavery has tended to make cannibalism fall into desuetude, because slaves were always the victims for ceremonial cannibal feasts.

The present attenuated distribution and form of puberty rites for Ovimbundu boys may be accounted for as follows: During the period of desultory warfare in northern Angola (1600-1800), ceremonies, which in Africa are usually associated with sedentary life, must have suffered interruption and curtailment. Such ceremonies

are typically allied, so far as Africa is concerned, with a forest culture with its sacred groves and facilities for seclusion during a period of three months or longer. Such a condition was lacking in the Benguela Highlands, which are sparsely wooded in comparison with the more northern tropical areas of Angola.

When the Ovimbundu settled in the highlands, warfare and distant caravan trade were factors that would tend further to disintegrate elaborate ceremonies requiring several months for their completion. As a supplement to these reasons for decline, there is the effect of European disapproval, and in some localities positive prohibition.

In addition to traits that have blended and those that have become obsolete, there arises the question of opportunities which have been neglected in the course of cultural growth.

The Ovimbundu, with local exceptions, do not use the milk or flesh of cattle, neither is the milk of goats utilized; vegetable food forms a large proportion of the diet.

The papaya (papaw) and the banana are not cultivated to any great extent by the natives. The raffia palm grows well in some parts of the Benguela Highlands, but the Ovimbundu do not use the fiber for anything except ropes. They have no raffia weaving such as is found in the Congo region.

Failure to utilize these vegetable products has to some extent a rational basis. The fruit of the papaya could never be more than an addition to the already generous vegetable diet, as it is unsuitable for consumption in large quantities owing to laxative properties; neither has it the food value and the marketable possibility of maize. The banana will grow at a height of 3,000 feet in the Benguela Highlands, but attention is required. Nights are cold, hence some naturally screened site should be selected. During the dry season the roots should be protected against too rapid evaporation, but this careful attention is foreign to native methods of agriculture. Use of raffia is discouraged by the presence of trade cloth and easy access to locally grown cotton, which is made into thread.

To account for the failure to use the milk and flesh of cattle is not easy, neither is the neglect of goat's milk readily explicable. Neglect of these foods is due to prejudice and conservatism, of which there are many examples in Africa. For instance, Hamitic tribes, of whom the Bahima are typical, avoid all vegetable food. Milk is their staple diet, and vegetable foods are regarded as positively unclean.

Cattle-keepers of southern Angola make butter in calabash churns which are gently swung on a pole. The Ovimbundu have taken cattle from the south and west, but have not adopted dairy products. The cattle of the Ovimbundu are valued as a standard of wealth; have great purchasing power; are used to pay taxes and fines; and, in addition to these social and economic values, are the most important sacrificial animals. This is an instance of the arbitrary selection of some traits of a culture complex, while other factors, even those of economic importance, are ignored.

Cultural losses, and failures to utilize factors which were accessible are, according to the foregoing examples, due to change of habitat from northern Angola to the Benguela Highlands; European contacts; long-established agricultural habit; and conservatism, which to some extent is a characteristic of tribes at all cultural levels.

#### INTEGRATION OF TRAITS

A study which is concerned with growth of culture, demands more than a historical, geographical, and mechanistic interpretation. Morphological and historical research assists in tracing origins and in forming hypotheses respecting the order in which the traits were brought together. But such inquiries are static rather than dynamic, and they are a necessary prelude to anthropological work rather than an ultimate aim.

To the methods of research already followed there should be added a psychological approach with the object of showing the way in which various elements of culture are blended and are made to function.

The following pages illustrate the way in which a field investigation is brought into contact with the welding of cultural elements, and the examples chosen call attention to principles that are responsible for the process of integration. This assimilation of cultural elements renders the study of an isolated trait impossible, as the following instances indicate. These illustrations are chosen from field notes, and are grouped in such a way as to emphasize the pivotal elements of Umbundu culture around which minor traits revolve.

Some of the examples given are intended to illustrate a relationship between language (which includes folklore, proverbs, and riddles) and nature knowledge. The latter is closely connected with hunting, food-gathering, and the selection of materials for handwork.

The inquiry then turns to occupations which indicate that sex dichotomy of labor is a fundamental principle of tribal life. In connection with the details of food supply and occupation, ritual acts are prominent, and in association with these the functions of the medicine-man are important.

Cultural liaisons are again illustrated when studying domestic animals, for this inquiry leads to a consideration of the social and economic importance of cattle, which are used in ritual connected with the death and burial of kings.

These are but a few instances indicating the way in which lines of investigation converge, though they may appear to be distinct. In fact the very division of a monograph into chapters is misleading in its suggestion of distinct divisions of tribal life, whose parts are actually a psychological unity.

When accompanying boys and men during their food-collecting and hunting expeditions a wealth of nature lore and a richness of vocabulary were discovered, and a vocabulary of one hundred and thirty words comprising names of birds, reptiles, mammals, and plants was prepared. Species are carefully distinguished, to such a degree that discussions respecting the correct native names for similar species tend to be prolonged and humorous.

When I realized the closeness with which the native observes the habits of animals, there was no difficulty in understanding why folklore stories of animals are so popular and so amusing in their descriptions of animal behavior. In addition to its associations with nature study, folklore reveals standards of conduct and processes of rationalization.

In collecting names of birds and their cries, and while recording hunting customs, I was informed of the bird Onjimbi which flies at night to give the sound of death to those who will not see the morning. Then there is a nocturnal bird called Esuvi which is able to catch spirits of the dead who are active at night. A spirit so caught dies a second death, but what this means I could not immediately discover. Later a man said he was sick because Esuvi had caught the spirit of his grandfather. This implies the belief that an ancestral spirit is a guardian whose function ends when a second death is experienced.

Study of natural history sometimes leads to a point of importance in social procedure. There is a bird Onduva whose feathers are used for decorating the head of a dead king and for embellishing the person of a medicine-man; the feathers may not be used in any other

way. Such instances as these came to light when my primary intention was a study of the use of wooden arrows for killing birds.

An inquiry about the names of trees and the use of timbers led to the topic of making and using wooden figures for magical purposes. Woodcraft, wood-carving, and religion are associated.

There is no fallacy so great as that of supposing that data may be collected and retained in mutually exclusive divisions. For example, a study of proverbs leads to native ideas concerning government, succession to office, and standards of conduct. The Ovimbundu say, "A turtle cannot climb on a tree stump, some one has to place it there." What is the meaning of this proverb? There are some men who occupy positions for which they have no ability; such men have been chosen through influence. The normal successor to chieftainship and kingship is the eldest son of the deceased man's principal wife, but if this rightful successor is stupid, some other son will be chosen. Yet the foolish youth may have friends who see their own advantage in having a weak ruler; they therefore combine to place him in office. The turtle has been placed on the tree stump, since it could not climb there.

In addition, folklore shows projection of the mentality of human beings into the lives of animals. Bird cries, with their supposed calls and answers, indicate that the birds have their family relationships involving strife, love, jealousy, and generosity. To the Ovimbundu, birds are a feathered human community.

Proverbs reveal a philosophy which is expressed by the German *Weltanschauung*. "If you are full of food, do not climb on a leopard's back; the leopard may be hungry." This means that one should not be foolishly exalted through good fortune. "You cannot tie a buck's head in a cloth; the horns will stick out," expresses the idea that crime cannot be concealed. "Hot water does not burn a house, and cold water does not make mush," is a sarcastic reply to one who boasts of things he cannot do. A riddle may express a philosophical train of thought. "What is it that lives while it dies and dies while it lives?" This is the log of wood the end of which is from time to time pushed farther into the fire. Like a human life, the log is being slowly consumed while yet living. Such examples as these call attention to a welding of thought, language, nature lore, and ideas that regulate conduct.

In considering food supply and occupations, division of labor on a sex basis is clear. Social sanctions have determined the appro-

priateness of certain tasks for males and females respectively, and individuals reflect these attitudes in their ideas and conduct.

My interpreter and others who were questioned laughed at the idea that men and women might interchange their occupations in the course of house-building. A woman collects wood for fuel, but not for house-building. Structural work is in the hands of men who dig the foundations, erect the poles, tie the crosspieces and add the roof. Women carry water for mixing the clay which is puddled by children; men, women, and children apply wet clay to the wattle walls. "Suppose a man should carry water?" I asked. "He would be laughed at and people would say that he was a he-woman," came the ready answer.

Women invariably make pottery among the Ovimbundu, but this is not always so in Negro tribes. Women of the Ovimbundu are likewise basket-makers, but they do not make mats, for this occupation is *considered suitable for men only*. Only women pound corn; before daybreak the heavy wooden pestles are at work and until sunset the rocks reserved for this operation are the centers of female activity, which includes singing and gossip. Only men herd cattle and only males are hunters. Women and children are the collectors of wild fruits and caterpillars, but only men take honey from the hives.

Agriculture and the preparation of food are entirely in the hands of the women. Men never eat with women; the latter have to carry the prepared food to the men's communal house in the middle of the village. Both men and women catch fish, but there are methods appropriate for each sex. There is a sex-division of labor without any implication of the inferiority of women.

Occupations cannot be studied merely in a formal way, for, although the tasks are performed every day, a ceremonial element is involved. A clay pit is consecrated by the killing of a fowl; so also is the rock which is used as a base for pounding grain. The young blacksmith is initiated after two years of apprenticeship. On this occasion a dog is killed with the hammer which the master made for his pupil and the blood of the sacrificed animal is sprinkled on the tools. The remainder of the ritual and belief has been described in connection with occupations of the Ovimbundu. Study of the blacksmith's work was begun as research in technology; but failure to purchase the large hammer, even for a tempting sum, led to the discovery of considerable ritual.

Abstinence from sexual relationships is enjoined on men and women who are going fishing. That copulation would induce the

fish to stay together at the bottom of the river, is the reason alleged for this taboo. A young hunter is ceremonially initiated. Throughout his life he has to make sacrifice to the ancestral spirits of hunters who are in the house where bows of famous hunters are kept; these ceremonies must be performed before a hunter leaves for the chase. A caravan is a commercial undertaking, but, before setting out, the head of a dead chief is asked for a guarantee of success; meanwhile a sacrifice is made by a medicine-man. A wooden image, when consulted by the medicine-man, indicates the correct caravan route. These instances illustrate a blending of the sacred and the profane in occupations.

Sexual relationships among the Ovimbundu form a basis of social life, as they do in all communities, but the sexual aspect is not all-pervading and completely dominant.

In early years children separate during play. Boys play games of hunting and warfare, enter into competition with bows and arrows, or amuse themselves with wood-carving. Girls find amusement in imitating their mothers in the occupations of making pottery and baskets, and in cultivating the fields. The small sums of money which a girl derives from the sale of produce from her own corn patch are personal property which she usually spends on trinkets and palm oil. This measure of economic independence, combined with considerable freedom of choice in marriage, indicates an individuality that has not been generally recognized.

I have mentioned among the Ovimbundu a system of friendship between boys and girls of from twelve to sixteen years, which permits the children to sleep together in the home of one of the girls in whose house the early evening has been spent. Cohabitation is forbidden, and pregnancy would be a disgrace. The practice is not unlike that of night visits by a lover in certain European countries during the seventeenth and eighteenth centuries (W. Goodsell, *A History of the Family as a Social and Educational Institution*, p. 365). Clearly sex is a factor that plays its part as a formative influence from infancy onward, until final emphasis of sex dichotomy is made by tribal initiations.

The social position of woman may be considered by selecting a few points from the data relating to courtship, marriage, and divorce. Marriages are sometimes arranged during infancy, but this does not invalidate the previous statement that considerable freedom of choice is allowed; a girl is not compelled to follow arrangements made during her childhood. A bride has to make contributions toward the

domestic equipment. Ritual enters into the introduction of the bride to her home, as was shown by explaining the functions of three elderly women, who erect the fireplace, bring new fire from the chief's house, and assist the bride in a ceremonial way. If a husband has reason to doubt the virginity of his bride, he bores a hole in her cloth with a firebrand, and makes her carry the cloth to her parents. But the marriage is not necessarily invalidated, since the husband is reconciled by a return of some portion of his gifts to the parents.

Some light is thrown on the ethics of family life by considering the meeting which takes place in the men's council house (*onjango*) before the bride goes to her new home. Here in the presence of relatives from both families the father of the bride says, "We are taking these things for our daughter, we hope she will not shame us." He turns to his daughter, enjoining her to be hospitable, never forgetting to feed her husband's people when they call.

Minor incidents help in a study of the psychology of family life. When husband and wife have quarreled, the latter goes away for a few hours into the bush and arranges that a number of burrs shall be clinging to her dress when she returns. If her husband silently and spontaneously picks these from her cloth, amicable feeling is restored.

Analysis of the grounds for divorce shows that women have their rights, though the male is in the more favorable position. In Rome the legal rights of a matron were slender, but in actual practice she held an important and honorable position. Similarly the status of an Ocimbundu woman is higher than the divorce laws imply.

The human side of family differences was well brought out by studying the interference and indirect influence of relatives on the relationship of husband and wife. Details have been given indicating that divorce is not entirely a matter of adjustment between families; the village chief may be called upon to act as arbiter. The final ceremony of repudiation, at which the husband slaps his wife's back saying, "It is finished," is a public rite. There is here a close connection between family consent and public ratification.

Although a woman may return to her parents under certain conditions which justify the divorce of the husband, parents are not anxious to encourage this practice. Marriage tokens would have to be returned to the husband of their daughter; moreover there might be a difficulty in securing another husband. In this instance a conflict occurs between parental obligations and cupidity. This is again shown by the argument which always arises respecting

the custody of a widow. The father, the brother, or the maternal uncle of the widow may take her. In the words of my interpreter, each says, "It is better that you should take her," and at last someone says, "I will take her."

A chief of Ngalangi revealed the most important aspect of polygyny when he apologized for the fact that only five of his eleven wives were present. The chief was anxious to emphasize the fact that he had eleven wives, though six were at work in the fields.

When one considers the prestige of village chiefs, and further reflects on the desirability of maintaining this power within family groups, the institution of polygyny becomes more understandable. In addition there is the necessity of having women to cultivate the fields. A polygynous system does not necessarily cause domestic conflict, because each wife has her own hut, fireplace, and utensils. Custom obliges a chief to spend four nights in each hut in regular sequence.

A first and principal wife is not offended by the introduction of other wives, for these reduce her own labor and announce the fact that she is the principal wife of a wealthy man. When photographing the king of Ngalangi with his wives, I observed that he sent the principal wife from the group in order to adorn herself with a piece of cloth whose value was greater than that of the clothing worn by any of the others. Among the Vakuanyama it was noticeable that the principal wife wore a head-dress of clay with five horns; and in addition to this she had costly necklaces of ostrich-eggshell beads, also more of the coveted *omba* shells than were allowed to other wives. In this way the prestige of the first or great wife is preserved.

The persistence of custom, the force of education through suggestion in early years, and the power of social attitudes, are well illustrated by the survival of kinship terms and the classificatory system of relationships, with its marriage prohibitions and sanctions of an arbitrary kind. The strength of the mores and the fundamental nature of this system of relationship in determining marriage, descent, succession, and inheritance, are indicated by the fact that the system is unaltered after three centuries of contact with Europeans.

The rights of a mother's brother extend so far as a sale of his sister's children to redeem his own debts; and reciprocally he is responsible for the conduct of his sister's children, even to the extent of paying fines for the thefts they may commit. This prerogative and responsibility of the maternal uncle is fundamental, and around the trait cluster points of law and legal procedure.

Ethnologists have often emphasized the supposed subjection of the individuals to the group. Initiation rites do tend to uniformity of conduct and group control; yet among the Ovimbundu there are renowned leaders of caravans, chiefs who are respected because of their justice and intelligence, also medicine-men, craftsmen, and musicians who display great individuality. Their self-expression in tribal life results from special aptitude and natural force of character, which qualities are made evident by daily actions, or through loquacity in the council house. In several localities live chiefs, who, by personality and tact, make possible a social adjustment between the indigenous culture and foreign intruders.

In former times kings were at the head of the legal and military systems, and in this capacity they acted when appeals were made from the jurisdiction of village chiefs. Prosperity of the country is today thought to center in kings both living and dead, and the extant ritual associated with the obsequies of a king is an illustration of this dependence. The importance of the medicine-man as a diviner, physician, and rain-maker is little diminished even at the present day.

The operation of village communism and the manner in which this centers about persons of importance is seen during the preparation of a new site for a village. A description has been given relating to the selection of the site, employment of communal labor, the creation and distribution of new fire, and the function of the medicine-man on this occasion.

Direct questioning concerning spiritual beliefs and the nature of a supreme being elicits little information, and that of a contradictory kind. As usual, actions are more important than statements. At a funeral, women dance, clap hands, and sing, "God has cheated us of a life." The inference seems to be that Suku gives and determines life. Beliefs respecting the good and bad spirits (*Olosande* and *Olondele*) are deeply ingrained in the lives of the Ovimbundu, who are confident of the need for placation of spirits by sacrifice, the use of wooden figurines, and the aid of the medicine-man. A study of the contents of a diviner's basket gives a clear idea of the powers and the activities of spirits; and the function of a spirit, which is able to hear and answer the living, is understood after observing the questioning of the corpse at a funeral. Without doubt, a belief in spirits and a reliance on the power of medicine-men are two of the fundamental ideas which permeate every thought and activity of the Ovimbundu, for by these agencies mundane matters are raised to a spiritual level.

I cannot find in the life of the Ovimbundu anything to support the opinion of W. C. Willoughby. This writer sees in the soul of every race an instinct for god that tells upon behavior, an upward urge that makes for betterment, due to the unwearied play of the spirit of god on the souls of man. The views of E. Torday and R. J. van Wing (*Dualism in Western Bantu Religion and Social Organization*, *J.R.A.I.*, XLVIII, p. 225) seem to be more applicable to the spiritual beliefs of the Ovimbundu.

The Ovimbundu have standards of conduct, codes of laws, crimes, and punishments. In addition to the *ekandu* (antisocial acts) already noted, *ohembi* is a liar, *okusapa* means to be greedy, and such actions are deprecated; but there is no deistic injunction toward the virtues of truthfulness, hospitality, and fair dealing.

Standards of conduct and social values are preserved by the educational forces previously mentioned (chapter VII), and in addition to these there are such controls as trial by ordeal, and divination to detect guilt. The satirical song is also a form of correction, though its application may be antisocial, for instance in taunting the sexually impotent.

Music and dancing are adjuncts for the preservation of social customs and the stimulation of collective emotions on which cooperation depends. Music and dancing are also aids to magical practices. For example, a friction drum is played while a medicine-man carries out his divination with the basket, and vigorous drumming takes place during treatment of the sick. Music and dancing were again seen to be of importance at a funeral ceremony.

These instances, which are chosen from many of like kind reported in the foregoing chapters, serve to indicate an interrelationship among the main aspects of tribal life. I have endeavored to choose from personal experience those facts and incidents which illustrate the mutual dependence of language, folklore, proverbs, nature lore, food supply, and occupations.

The sexual division of labor, the connection of ceremonial with occupation, the relationship of the sexes, and the position of woman, have all been brought forward as examples of social controls.

The persistence of belief and custom despite foreign influences; the nature of government, including the psychology of prestige and leadership; spiritual beliefs; the training of children; and the value of music and dancing, have likewise been emphasized as coordinating

principles among the religious, social, and economic aspects of tribal life.

In searching for some monism which integrates tribal thought and conduct, I would emphasize the relationship between the sacred and profane. The former is derived from the latter by ritual acts which are frequently, but not exclusively, connected with the medicine-man and spirits of the dead. These departed spirits do not sever their connection with the living. On the contrary, they are concerned with the affairs of men, which they handle benevolently or malevolently according to caprice.

Attention has been called to the importance of fire when ceremonially kindled and distributed; this is but a single instance of the sacred use of an everyday commodity. A woman's belt is an ordinary item of clothing, but it may be something more important. A woman who is the mother of girls only, exchanges belts with the mother of boys only, and in future the mother of female children will give birth to boys, and conversely. This is the simplest instance of transfer from a secular to a magical use without resort to an intermediary person such as the medicine-man.

Bows, mats, and staffs are articles of everyday use until their owners are dead and the articles are deposited in the house of bows. Such a house is then sacred, because the ancestral spirits can be induced to enter it to grant favors after sacrifice has been made. Cowrie shells were normally a medium of exchange, but they may become a charm in order to induce conception. A snake's backbone acquires power when threaded by the medicine-man and placed round the neck of a patient who suffers from rheumatism. A cooking pot of clay is entirely secular until it becomes the property of a hunter, after which no other person may use it. A piece of an ant hill is merely earth. But if the belated traveler takes such a piece from the top of the hill and places it in the fork of a branch there will be an extension of daylight. A ritual element enters in the spell, "O sun, wait for me a little while."

The unifying and binding effect of magical rites, simple or complex, private and public, is the warp of the fabric by which the weft threads of the social pattern are bound together. To vary the metaphor, tribal life is a sphere of action, a universe having principal units around which others revolve. Each unit of the structure has a course and movements peculiar to itself, but there is no actual isolation from the influences of other bodies.

The part played by Portuguese influence in the formation of the culture of the Ovimbundu has previously been recognized, and in conclusion reference should be made to Portuguese and Ovimbundu relationships at the present day.

Native trade and military organization were at one time aided by caravan journeys resulting in the acquisition of slaves and ivory, which were traded for guns and powder. But this caravan trade touching remote parts of central and east Africa is now obsolete. Therefore a breaking down of the economic structure has occurred, but this has to some extent been counteracted by the development of agriculture, which yields large crops of maize and beans.

In the administration of law a new social consciousness has arisen. Portuguese government is of a somewhat direct kind, yet village chiefs and kings have some juridical rights. Appeal to a chief or a king was the old method of securing justice, and at present such appeal may be made by an aggrieved Ovimbundu; but should the appellant be dissatisfied he turns to the Portuguese court.

Portuguese policy aims at making the Ovimbundu a social reflection of the Portuguese themselves. European clothing and manufactures are favored, and Portuguese speech is encouraged, to the detriment of the native Umbundu.

Initiation ceremonies are forbidden, but the bush is wide and protective. To prevent these ceremonies is to take the core from the social system, which has already been weakened by recruiting of labor, so leading to disturbance of family life and village organization. Christian missions have an influence on dress, beliefs, and habits, but these effects appear to be local.

Although this report has been chiefly geographical, ethnological, historical, and analytical, no apology for the method chosen is necessary since this kind of approach is fundamental. I might, in compliance with a modern trend, have made the monograph center in persons, especially Ngonga. By making a close psychological study of his early years, his native environment, and changes in mental attitude arising from contact with Portuguese rule and American missions, an illuminating record of the result of conflicting social forces could be given.

In a sense, Ngonga, who speaks English, Portuguese, and Umbundu fluently, has been the focus of study, and care has been taken to recognize his personality in this report. I realize that in Angola work of an intensive psychological and sociological kind remains to be done by means of a penetrating analysis of many

individual careers. Inquirers should closely observe persons who are yet molded chiefly by their native environment, and these individuals should be compared with those who have left their own culture, either permanently or temporarily, to form part of a European social and economic system.

Ethnologists, educationalists, and administrators are concerned with the effects of conflicting cultures on individual attitudes and the stability of native institutions of all kinds. This type of psychological and sociological study has not been attempted in detail here, and I am not confident that research so closely concerned with administrative methods would be encouraged from a foreigner, though he might be welcomed in Angola as a collector and ethnologist.

During four centuries of foreign contacts the Ovimbundu have continued their resistance to European influence, and field records of 1929 are clear evidence of the tenacity of indigenous culture. But, unfortunately, the decline of indigenous industries, thought processes, institutions, and language has begun. Yet I venture to hope that this monograph will lay a dependable and timely foundation for future studies of behavior, for on research of that kind depends a sympathetic understanding of Negro reaction to European intrusion.

 Angola, see chapter headings; and Congo, 286; and Rhodesia, 296; and South West Africa, 303  
 Animals, carved in wood, 164; see Cattle, Chickens, Domestic Animals, Goats, Hunting, Nature Lore, Pigs, Sacrifice, Sheep  
 Antelope horns, 143  
 Anthill, 137, 299  
 Anvil, 159  
 Arabia, 328  
 Archaeology, 105, 166, 207, 327  
 Archery, 120, 141, 291; see Arrows, Bows, Wooden Arrows  
 Area of Angola, 108  
 Arrows, 95, 122, 123, 137, 140, 161; details of construction, 172-174, 299; release of, 318  
 Art, 97, 162; see Burned Patterns, Colors, Dyes, Painting  
 Ashanti, 198  
 Assagai, 175, 310; see Spears  
 Ax, 93, 94, 122, 161, 167  
  
 Babende, 293; see Congo  
 Babunda, 129, 163; see Cangamba  
 Baby, see Childhood, Lactation, Marriage, Naming, Pregnancy  
 Baganda, 306  
 Bags of fiber, 170  
 Bahima, 336  
 Bahuana, 293  
 Bailundu, town of, 164, 192, 205, 207, 209  
 Bakongo, 288  
 Bakuba, 322  
 Baloki, 291  
 Baluba, 322  
 Bambala, 114, 290, 302, 314  
 Bananas, 148, 336  
 Bangala, 290  
 Bantu, prefixes, 106, 107, 115; Negroes, 128, 191; language, 234; religion and social system, 314-316  
 Banyankole, 314  
 Baobab tree, 109  
 Bapedi, 309  
 Bark, cloth, 131, 177, 229, 297, 301, 320; general uses of, 101, 140, 145, 146, 150, 161, 170, 174, 183, 210  
 Barotse, 297  
 Barrenness, 102, 182; see Charms, Divorce  
 Bashilele, 293, 317  
 Baskets, 93, 157, 169-171, 319  
 Basonge, 290  
 Bastards, 189  
 Batatela, 292  
 Bavili, 288  
 Bayaka, 116  
 Beads, 117, 120, 130, 132; see Ornament  
 Beans, 146  
 Beds, 210  
 Beer, 118, 141, 149, 167, 169, 180, 185, 200, 210  
 Bees, wax, 119, 140, 156; hives, 161; see Honey, Wax  
 Bellows, 118, 160  
 Belts, 176  
 Benguela, town, 110, 157; Highlands, 108, 109, 118, 127, 141, 313  
 Berg Damara, 303, 308  
 Betrothal, 179; see Courtship, Marriage  
 Bihé, 109, 114, 116, 120, 124, 296, 297  
 Birds, 134-136, 140, 150, 172, 211, 319, 338; see Arrows, Hunting, Wooden Arrows  
 Blacksmith, 98, 118, 155, 158-161, 163, 313, 314, 330  
 Blackwater fever, 281  
 Blankets, 210  
 Bleeding of patients, 101; see Cupping  
 Blood brothers, 187, 306, 316, 327; sprinkled, 156, 159, 166  
 Bones in charms, 300  
 Bows, 95, 141, 172-175, 209, 317, 322  
 Bracelets, 131, 168  
 Brass, tacks in hair, 131; nails, wire, 176  
 Bride, 180; see Courtship, Marriage, Tokens, Virginity  
 Bridges, 99  
 Brothers, see Kinship

- Brushes, 166
- Bulls, castrated, 154
- Burial, of commoners, 265-269; of hunters, 121, 273; of kings and chiefs, 121, 271; of medicine-man, 270
